11543. '29 QSO Party Power Supply

Yahoo group: antiquewirelessassociation (2010 — 2015)

From: steve_n8ye
Topic: 11543 Message: 11543

I'm planning to build a really stiff power supply for my '29 TPTG.
It will be choke input with a heafty bleeder. The 80 tube has
too much internal resistance. What would be a good tube? Would the
83 qualify?
Thanks
Steve N8YE

If you want to use "old" type tubes put several

in parrallel to lower the resistance.

Yes, I got some fan mail, and I thought my chirp was pretty minimal.
I guess one has to have a perfect signal as per rice box quality
to get by on the ham bands today. I wasn't even running my Ford coil
at the time Hi. Strangly enough, I have never gotten fan mail for using the Ford buz box.
Having a really weak signal helps in that regard. I had to learn about OCR (optical
character recognition) to attach the OO notice to this posting.

I thought the conditions were pretty good. No qrn, no contests. I heard ve7sl each weekend
on 80 so they had to be pretty good. I
did hear LNG but only briefly and didn't manage to get a qso.

Its like electric trains under the Christmas tree. Exciting once a
year, but wouldn't want to do it all the time.

11546. BK 1929 QSO Party Observations

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2011-12-12 19:40:17 UTC
From: Ron Barlow
Topic: 11538 Message: 11546

Hi Scott,
 Many, many thanks for your efforts, that do so much to make the BK 1929 QSO Party possible! Congratulations on your ufb score! Also, many thanks for the QSOs on both bands. Your signal was flawless, on both bands, with a pure DC note, no chirp, and no observable drift, at all. Wow! That is quite an accomplishment, especially on 40m! You did an absolutely superb job of constructing, adjusting, and perfecting your Colpitts!
 I believe that I heard more Colpitts type transmitters this year, than in the past; WA9WFA (80m & 40m), K1VVC (80m), VX3XZ (80m), and all produced superb sounding signals. Many others, using Hartleys, TPTG, & TNTs, of course, also had great sounding signals.
 There were several other, less flawless signals, as well, and I also definitely enjoy hearing them! IMHO, they add much to the spirit of the QSO party!
 I do recall one signal that was jumping around, beyond the fixed, ~ 800 hz bandpass, of my hb rx. No serious problem, however, as a few requests for repeats yielded the missing info, that my QSO partner had sent, while his xmtr was on "another" frequency.
 Special kudos to the two Steves, VE7SL, and KK7UV, for their great "ears", as both were able to copy my "flea power" signal, from way out west!
 I regret that I was unable to spend more time operating, especially during the first weekend, when you mentioned that condx were fb on 40m, Scott. I was only QRV on 80m, that day (Sunday), and only for the final 50 minutes, of the event.
 IMHO, your assertion that only "29" to "29" QSOs should be included, in the scoring, is "spot on".
 Thank you for the explanation regarding all of the ufb activity from Minnesota, Scott. Kudos to Harold, for his efforts. Does the Mighty Midwest Glowworm Society meet via radio, at all?
 There is much time to discuss this point, but would it be possible to suggest operating day and times for 160m, prior to the 2012 BK QSO Party? I fear that 80m activity may suffer unduly, if such a time designation is not provided for. There doesn't seem to be a serious problem with 40m vs 80m. Propagation is poor, on 80m, during the day, due to ionospheric absorption, and 40m is poor at night, due to QRM. etc. However, both 160m and 80m would be at their best, at night, and thus the cause for concern.
 Another, possibly larger concern, aside from activity dilution, is the fact that the first weekend of the BK QSO Party coincided with the ARRL 160m contest, this year, and I believe that this is the usual situation. I believe that our QRP AWA signals would be lost in the din, during this contest event!
 Several years ago, I moved my 80m Hartley down to 160m, and attempted to make a few QSOs, during the the January Linc Cundall Memorial event. I immediately learned that another contest (CQ World Wide 160m contest?) was in effect, and the QRM was beyond incredible. I heard only one AWA signal (N8YE, I believe), during several hours of operation, and I was unable to get his attention. I was unable to find anyplace to even attempt to call CQ! As soon as I found a quiet frequency, someone else would crank up, calling CQ, with a huge QRO signal.
 Therefore, I believe that the best choice, for BK QSO Party operation, on 160m, may be during the 2nd weekend, of the BK QSO party??
 Many thanks again, to everyone who participated, for all of the great fun!

Subject: [AWA] BK 1929 QSO Party Observations - WA9WFA

Wow wow wow, what a great time! My thanks to all who participated in this 26th or 27th 1929 QSO Party.

It was great seeing all my old 1929 friends again. It was fun working the usual gang, meeting some new recent additions to the BK, and finally working some of those stations that I haven't worked in years or ever heard. There are still a bunch of New England stations that I still haven't worked yet. I worked several stations that I haven't heard in years like KC1FB, K1TMJ, WA1JOS, WA3YNW.

I was happy to hear AA9DH from Illinois back this year. He didn't participate last year.

I have been processing the logs for maybe 6 or 7 years now and I always come across a bunch of stations that I haven't had the pleasure of working yet.

Plus I heard another 8 or 9 stations that I just couldn't pick up. I heard and called Tim W1GIG after he finished with another station but the band changed and I never heard him again.

80m was fabulous both Saturday nights. At my QTH, conditions were good, band noise low, and now line noise. Probably the best 80m conditions in several years.

40m was fabulous the first weekend. 2nd weekend Sunday morning it was fair, dead till later afternoon. Moving from the garbage pit of 7040 to 7110 worked out really well! There was just a tiny bit of ssb, one AM broadcaster on 7105 at times, and a couple of digital stations around 7105. Compared to 7040 with all it's digital racket, RTTY contesters, high power cw, and SSB, was a vacation! Clearly there was more 40m activity this year than any other year in my opinion. I worked around 19 stations on 40m.

I used my push pull 2x210 Colpitts on both 80m and 40m with a pretty good signal. If you remember contacting me, let me know what the Colpitts sounded like at your station. I heard alot of good sounding stations on 80m and heard more chirpers and chowpee chowpit stations on 40m. I heard a couple of stations that were difficult to copy because their frequency was moving around quite a bit. I heard one raw ac station. I heard one station, and I'm not telling, whose signal was so nasty that I could barely understand the report because the frequency would abruptly and randomly shift from a few hundred cycles to 1 KC or more, in the middle of a dit or dah, doing this wildly. I heard a few of my favorite wind modulated signals.

From my rough numbers I worked 57 authentic 29 stations, about 19 on 40m and 38 on 80m. The only non- 29 station worked was W2AN and I called him because I wanted to hook up with Ed at the AWA headquarters stations. You know, I never liked the rule change where 'the occasional' modern station counted, and I think we should change it back to the old rules, 29 to 29 contacts only counting. Last year a couple of stations were including up to 10 modern contacts in their score. To me this seems to be more than the "occasional" contact that the rule change envisioned, and it skews the scores. I haven't heard of any modern stations contacting a 29'er and then signing up to join the AWA. I think it's a

distraction.

Next year 160m will add a new dynamic to the QSO party. The seasoned 160'ers like Eddy and Steve will feel right at home while us newcomers to 160m will be dipping our toe on the water. Gads, that's going to be one big coil if I use the Colpitts.

I was pleased to work some westcoasters in the form of VE7SL, KK7UV, and W8KGI in NM. Don't know why the west coast isn't more active. I've been told by some past westcoast operators that they don't hear anything from the midwest or east coast. I know Steve VE7SL is hearing everyone, and I tell you KK7UV was heard here on 80m and 40m alot of the time. I'll bet VE7SL and KK7UV worked a ton of stations.

Steve asked whats going on in MN. There is a very strong MN group consisting of around 12-14 stations. Much of the reason is due to Harold KB0ROB who uses his 29 equipment all year around. He is telling everyone about it too. He put together a packet of information on how to build a receiver and transmitter, sends it free to people he contacts on cw and ssb. He's shipped parts and tubes for free to newcomers. There is a loose group in MN called the "Mighty Midwest Glowworm Society" and we discuss 29 transmitters and receivers all year around.

That's it from here. Thanks again to all the folks who dig deep into the noise and pulled these 1929 peanut whistles out of the noise.

73, Scott WA9WFA

Having been a frequent competitor in the ARRL 160 meter contest over the years, I concur with Ron's comments. Crowding and QRM is quite possibly worse in that contest than any other. There is no way we could co-exist with it. Given that the first weekend of the BK appears to always coincide with ARRL 160, we have only the second weekend to work that band. I suppose that is not a big problem.

Initially I found myself very torn between working the BK both weekends or working ARRL 160 the first weekend. As it turns out I did not operate in either event this year, so I had no personal conflict of interest! It is impossible to express my extreme disappointment at not being able to participate in the BK but it was a choice forced by circumstance. I did very much enjoy listening! Hopefully things will be different next year and I can join the party.

Regards,
Paul N1BUG

I do agree that unless our BK dates are changed, which I don't think is a particularly good thing to do, any and all 160m activity will have to take place on the second weekend only. For the most part I see this as a good thing as I'm sure that, like myself, most will be reluctant to leave 80m for any significant amount of time, to look for topband contacts. In a way, the conflict is fairly helpful as I doubt anyone would want to tear themselves away from 80m on weekend one when there are so many fresh stations to work but by the second weekend, one might feel more disposed to taking an hour's swing up to topband to see what they might snag. I hope that what it might come down to in the end, is a 'gentlemen's agreement' on a topband time so that we all look there at the same time, making the chances of several contacts much more likely than with everyone doing a random check.

Steve,

I'm pretty sure (but not certain) the '83 was around in 1929, but I don't think the contest restrics you to 1929 tubes in the PS (any such restriction would be self-imposed. It would be a good choice - nice low constant forward drop of around 15V (IIRC) per plate.

The only caveat is that it may be a noise source in your RCVR, so it is best to have a separate plate transformer and "key" the primary with a set of contacts from your TR relay/switch. I used to use an 83, and did not have a separate plate transformer, so I switched to an 83V, which I'm pretty sure was "born" in the early thirties. Not as good as an 83 for voltage regulation, but better than an 80.

I collect WWII & later military radar & IFF gear. I have 2 NOS pilot control boxes for the ABA-1 & 2 NOS CWD-21AAX dynamotors for the ABA-1. I'm interested in trading one each of these for the BC-645 USAAF versions. I also am looking for a BX-37 B metal box with complete NOS cam set & NOS BC-645 antenna or box of 2 antennas. I'm also interested in any WWII IFF/radar gear & am willing to pay a premium. Also C-544/APX-6, APX-6 antennas, RT-279/APX, APX-1, APX-2, APS, APT, APQ.

Anyone interested can reoply off list. Thanks!

John,

I overlooked that - not only are they tubes, but they captioned the
picture incorrectly and called them transistors:

http://www.nytimes.com/imagepages/2011/12/21/business/KRIM-obit.html

11566. Alexanderson Transmission on Christmas Eve at 08:00 UTC, 17.2 kHz, CW, 200kw

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2011-12-22 23:58:57 UTC
From: Larry Dighera
Topic: 11559 Message: 11566

Merry Christmas. Here's a little nostalgia for us old timers:

Subject: Alexanderson Transmission on Christmas Eve at 08:00 UTC, 17.2 kHz CW

SAQ Transmissions

Transmission on Christmas Eve
The traditional Christmas transmission takes place on December 24th. A message will be sent at 08:00 UTC, and we start the transmitter about half an hour in advance for tuning. The frequency is 17.2 kHz CW.

QSL-reports are kindly received:

QSL reports can be given via:

- E-mail to: info@...

- or fax to: +46-340-674195

- or via SM bureau

- or direct by mail to: Alexander - Grimeton Veteranradios Vaenner, Radiostationen, Grimeton 72,
S-432 98 Grimeton, SWEDEN

Note: SAQ is now a member of the Swedish Amateur Association (SSA) and "QSL via bureau" is OK.

In 1895 the Italian physicist and later Nobel Prize winner Guglielmo Marconi (1874-1937) had realised wireless telegraphy, i.e. the possibility of transmitting information with the help of radio waves.

The communication across the Atlantic did not function well during World War I and the need of telegram traffic with America was great. The Swedish Parliament therefore decided in 1920 that a Swedish long wave transmitting station and a receiving station should be built under the direction of the "Telegrafverket".

Important for the location of the establishment was that the wave propagation path was run across open waters - south of Norway and north of Denmark and Scotland. In Grimeton, east of Varberg, the open landscape gave free way for the radio waves out towards the Western Sea and besides, the name was easy to pronounce for Americans.

The Great Radio Station was built during the years 1922-1924.

The transmitter, the heart of which is an alternating- current generator (alternator), was developed by the Swedish engineer Ernst Alexanderson, pioneer in radio, employed at General Electric in Schenectady and chief engineer at Radio Corporation of America (RCA).

In the autumn of 1923 the establishment was ready except for the six 127 meters high antenna towers, which were delayed one year because of strikes at the ironworks. The towers are placed at intervals of 380 meters with the 46 meters long cross-arms on top carrying the eight copper wires, which make up antenna capacitance and feed energy to the six vertical radiating elements.

A little village with dwelling houses for seven families was built for the employees.

On December 1, 1924, the great radio station Grimeton went into traffic with the call signal SAQ on 16.1 kHz (wavelength 18.6 kilometres) soon enough changed to 17.2 kHz (wavelength 17.4 kilometres).

On July 2, 1925, the establishment was formally inaugurated. King Gustaf V arrived by car from the Varberg railway station in company with among others the constructor Ernst Alexanderson.

During the station's now more than 75 years of history much has happened. 1938 short-wave tests were made. World War II accelerated the development and the number of short-wave transmitters increased rapidly and there are still some twenty transmitters at work. FM- and TV-transmitters were placed here and base stations for different mobile services were also established gradually.

Regarding the CK-722, I read somewhere that early production was a dull gray color, and then Raytheon switched to the bright blue case that made the CK-722 famous. Anyone know for sure if that's true? I have a few of each color.

11571. WTB: WW2-STYLE J-SLOT TUBE SHIELDS

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2011-12-24 22:06:19 UTC
From: Jack
Topic: 11571 Message: 11571

My RT-34/APS-13 (an 'Archie' tail warning radar of A-Bomb fame) arrived the other day & I finally got around to unpacking it & opening up the case. As I knew from the seller, somewhere in its existence 4 6J6 7-pin miniature tubes had disapeared along with 2 of the J-slot tube shields. I have gotten the replacement tubes but getting exact replacements for the tube shields has proven to be more difficult.

The 1944 version of the shield has only a hole in the center of the top while the ones available in my searches have additional diametrically opposed rectangular cutouts on each side of the hole. I have 20 of these coming so it may simply be a matter of replacing all of the old style shields with the newer ones. While no one might notice the difference, it would not be my ideal restoration.

If anyone has 2 spare old style J-slot tube shields they could part with please contact me off list. Thanks!

Jack

Try Tubepad. It's free and easy to use. It has libraries of symbols and you can add to them with your own symbols or edit existing ones. It's based on Windows Paint. I've been using it for a couple of years now and It's the best I've found anywhere.

11588. Southern Toy Company catalog anyone?

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2011-12-31 18:26:27 UTC
From: Robert
Topic: 11588 Message: 11588

Folks,

I've got a Remler Infra+Dyne chassis - no cabinet... I'm thinking about making a replica cabinet. There are a number of designs you can find in the EXTENSIVE advertisements in RADIO magazine from 1926 to 1929. But Ron Lawrence suggested that maybe a NC native like myself could consider making a replica of a radio cabinet made by Southern Toy Company in Hickory, NC.

Southern did actually run small adverts in RADIO and RADIO NEWS (and maybe others). My memory and ads I've run across this week just have line drawings of really basic knock-down cabinets.... Nothing close to a grand enough scale to suit the Infra+Dyne.

The ads say to send for a catalog... So, does anyone have a STC catalog that would show more ambitious cabinets that would have been available in 1926/27?

May your 2012 be better than this 2011 turkey...
Robert

****

*_CAR TUNES_*

Radios are so much a part of the driving

Experience, it seems as though cars have always had

Them. But they didn’t. Here’s the story.

SUNDOWN

One evening in 1929 two young men named William Lear and Elmer Wavering drove their girlfriends to a lookout point high above the Mississippi River town of Quincy , Illinois , to watch the sunset. It was a romantic night to be sure but one of the women observed that it would be even nicer if they could listen to music in the car.

Lear and Wavering liked the idea. Both men had tinkered with radios – Lear had served as a radio operator in the U. S. Navy during World War I – and it wasn’t long before they were taking apart a home radio and trying to get it to work in a car. But it wasn’t as easy as it sounds: automobiles have ignition switches, generators, spark plugs, and other electrical equipment that generate noisy static interference, making it nearly impossible to listen to the radio when the engine was running.

SIGNING ON

One by one, Lear and Wavering identified and eliminated each source of electrical interference. When they finally got their radio to work, they took it to a radio convention in Chicago. There they met Paul Galvin, owner of Galvin Manufacturing Corporation. He made a product called a “battery eliminator” a device that allowed battery-powered radios to run on household AC current. But as more homes were wired for electricity, more radio manufacturers made AC-powered radios. Galvin needed a new product to manufacture. When he met Lear and Wavering at the radio convention, he found it. He believed that mass-produced, affordable car radios had the potential to become a huge business.

Lear and Wavering set up shop in Galvin’s factory, and when they perfected their first radio, they installed it in his Studebaker. Then Galvin went to a local banker to apply for a loan. Thinking it might sweeten the deal, he had his men install a radio in the banker’s Packard. Good idea, but it didn’t work – half an hour after the installation, the banker’s Packard caught on fire. (They didn’t get the loan.)

Galvin didn’t give up. He drove his Studebaker nearly eight hundred miles to Atlantic City to show off the radio at the 1930 Radio Manufacturers Association convention. Too broke to afford a booth, he parked the car outside the convention hall and cranked up the radio so that passing conventioneers could hear it. That idea worked – he got enough orders to put the radio into production.

WHAT’S IN A NAME

That first production model was called the 5T71. Galvin decided he needed to come up with something a little catchier. In those days many companies in the phonograph and radio businesses used the suffix “ola” for their names – Radiola, Columbiola and Victrola were three of the biggest. Galvin decided to do the same thing, and since his radio was intended for use in a motor vehicle, he decided to call it the Motorola.

But even with the name change, the radio still had problems:

* When Motorola went on sale in 1930, it cost about $110 uninstalled, at a time when you could buy a brand-new car for $650 and the country was sliding into the Great Depression. (By that measure, a radio for a new car would cost about $3,000 today.)
* In 1930 it took two men several days to put in a car radio – the dashboard had to be taken apart so that the receiver and a single speaker could be installed, and the ceiling had to be cut open to install the antenna. These early radios ran on their own batteries, not on the car battery, so holes had to be cut into the floorboard to accommodate them. The installation manual had eight complete diagrams and twenty-eight pages of instructions.

HIT THE ROAD

Selling complicated car radios that cost twenty percent of the price of a brand-new car wouldn’t have been easy in the best of times, let alone during the Great Depression – Galvin lost money in 1930 and struggled for a couple of years after that. But things picked up in 1933 when Ford began offering Motorolas pre-installed at the factory. In 1934 they got another boost when Galvin struck a deal with B. F. Goodrich tire company to sell and install them in its chain of tire stores. By then the price of the radio, installation included, had dropped to $55. The Motorola car radio was off and running. (The name of the company would be officially changed from Galvin Manufacturing to “Motorola” in 19 47.)

In the meantime, Galvin continued to develop new uses for car radios. In 1936, the same year that it introduced push-button tuning, it also introduced the Motorola Police Cruiser, a standard car radio that was factory preset to a single frequency to pick up police broadcasts. In 1940 he developed with the first handheld two-way radio – the Handie-Talkie – for the U. S. Army.

A lot of the communications technologies that we take for granted today were born in Motorola labs in the years that followed World War II. In 1947 they came out with the first television to sell under $200. In 1956 the company introduced the world's first pager; in 1969 it supplied the radio and television equipment that was used to televise Neil Armstrong's first steps on the Moon. In 1973 it invented the world's first handheld cellular phone. Today Motorola is one of the second-largest cell phone manufacturer in the world. And it all started with the car radio.

WHATEVER HAPPENED TO…

The two men who installed the first radio in Paul Galvin's car, Elmer Wavering and William Lear, ended up taking very different paths in life. Wavering stayed with Motorola. In the 1950's he helped change the automobile experience again when he developed the first automotive alternator, replacing inefficient and unreliable generators. The invention lead to such luxuries as power windows, power seats, and, eventually, air-conditioning.

Lear also continued inventing. He holds more than one hundred and fifty patents. Remember eight-track tape players? Lear invented that. But what he's really famous for are his contributions to the field of aviation. He invented radio direction finders for planes, aided in the invention of the autopilot, designed the first fully automatic aircraft landing system, and in 1963 introduced his most famous invention of all, the Lear Jet, the world's first mass-produced, affordable business jet. (Not bad for a guy who dropped out of school after the eighth grade.)

Just searching for info on a 1938 Mullard radio I have in my collection and hit on this YouTube link. "La Grande Revue Philips - 1938"

http://www.youtube.com/watch?v=lS0iCCB-sxw

It is a four minute advert for the Monoknob but still amazing...

Enjoy,
Robert

11599. AWA LC OT CW Contest Warmup

<http://2.bp.blogspot.com/-V7ND-ZQK5fY/TxFsHVh1cCI/AAAAAAAASFs/qIy-FebKrgI/s1600/wlw_book.gif>Greg,
KC2DWF, sent me this link to a really great web site
<http://www.ominous-valve.com/wlw.html> about the AM
broadcast station WLW (aka "The Nation's Station"). Brace
yourselves guys, for we are now moving out of QRP land: The
exciter on this baby is 50 kilowatts! The modulator could
produce 400 kilowatts of AUDIO! The article is very well
written, obviously done by an aficionado of high power RF.
There are some great lines in there. Here is a sample:

This brings up the real fun part of 1934 AM broadcasting -
NO LIMITERS!WLW, like any big-time station at the time, gave
the Full Monty: 100 per cent modulation. Now, radio
textbooks always have cute little pictures of sine waves at
100%, but people don't talk in sine waves. They don't beat
drums, play hillbilly music, or yodel in sine waves. If the
studio asked the big rig for some outrageously asymmetrical
upward modulation barely crossing zero at all, the
DC-sucking beast said FEED ME and obliged - briefly.
Voltmeters dipped at the power company, antenna current went
haywire, cows felt funny tingles in odd places, and various
shotgun-loud bangs and sparks filled the transmitter building.

Have fun, but don't get any QRO ideas...

Here's the link to the article:

11605. Wave meter ?????

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2012-01-23 20:19:35 UTC
From: John
Topic: 11605 Message: 11605

I found a very nice mahogany box on a table at the Ft Worth cowtown Hamfest this last weekend and bought it. It is approx. 13 inches square. Upon opening the box there is a Bakelite panel with a dial and a small light bulb at the top. The dial is connected to a variable cap. There are 4 very nicely turned wooded coil forms with wire windings. Two of the coils are tight but the other two are loose, like someone was trying to remove turns. On the side of the panel there are two U-shaped metal studs protruding from the side and the coils have little studs on them that fit nicely into the panel and there are small insulated nuts that be turned to tighten the coil in place.

The dial is calibrated to 100 and there is a small reference logging line at the top. Inside the case is 2 sheets of very old brown paper and on them is written wavelength, frequency, dial number and the call signs of some 3 letter broadcast stations.

I suppose that this chart was a way to calibrate the instrument..

There are to small holes at the top of the front of the case which I believe at some time held a ID plate of some sort.

I am assuming that you selected the coil that corresponded to general freq band and that somehow as you adjusted the variable cap that the light would glow indicating that you were on frequency? I have no idea how that would have worked.

I can send pictures if anyone is interested.

Thanks, John NS5Z

11606. Re: [AWA] Wave meter ?????

John - i used to have a collection of wavemeters. I may be able to ID it from a photo. Too bad the nameplate is gone.
It was held next to the final xmtr coil in the old days when it was on.
some also had a detector attached.

Will

Hi Will thanks for the reply. I will send you some pics this evening after I get home.

How close did it have to be? As this thing would seem to be a little unyielding to holding it over the transmitter. I do now remember seeing a picture in the 1926 ARRL Handbook (the reprint) of a pictorial of a station with a wave meter as part of the station.

So if I build the TNT transmitter, I need this to find out what freq I am on?

What do you mean a detected attached, do you mean that they used it as a receiver also?

Do a Google search on "Millen Wavemeter"!

The Millen wavemeter is a miniature version of what you have. They were very common in the broadcast industry.

Actually Bob, what I did was to try and send 4 different pictures. So it was not a matter of try, try again and I think I apologized as soon as I knew that I done it wrong. One thing is for certain Bob, there really is not much traffic on this board, that one would have thought that you could have kept your smart ass comment to yourself AND before you say you were misunderstood, I am tired of people being rude and demeaning and hiding behind a smiley face.

I am 60 years old and the only men that "kid" with me are guys I have known since I was 10 and it was ok to make wise cracks at another's expense.

Good grief is there no where that adults go to share information. So before I am thrown off, aloha all. Please unsubscribe me.

11622. Southeastern Antique Radio Society meet, February 25

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2012-02-04 19:05:55 UTC
From: W4RON@carolina.rr.com
Topic: 11622 Message: 11622

February 25, 2012 from 7 AM to 2 PM (no sales before 8 AM)
Jim Miller Park
2245 Callaway Road
Marietta, GA 30006
Park Telephone (770) 528-8875

There are NO admission or auction fees whatsoever. The facility will open at 7:00 AM for dealer set up. Dealers pay $15.00 for each 8 foot table and one chair (see web site below for table pre-registration option). No sales will occur before 8 AM.
The Jim Miller Park indoor facility is the perfect venue for our growing event. It is three times larger than our previous location so it will accommodate many more buyers, sellers and display areas. In fact, eight foot tables are now available to sellers and there will be plenty of space for larger sale items. The facility features ample parking, easy loading and unloading access, PA system, restrooms and onsite food vendors. We expect RADIORAMA 2012 to be the biggest and best event yet.

More information:

From: n4tl2
Topic: 11623 Message: 11623

Today I went to the Frostfest in Richmond Virgina. I purchased a copy of "The A.W.A Review" volume 1 from 1986. On page 7 near the bottom they use the term "decrement" for a spark transmitter. "the decrement could only be brought down to nine-tenths, whereas seven-tenths was the limit. So the spark transmitter had to be retired. This was in 1922. So what is a "decrement" for a spark transmitter?

Thanks, Tom, N4TL

Hi John - I am working on an article on the Seefred brothers, 6EA and 6EB. HistorySan Jose/Perham collection has their logs and other papers going back to before 1920. They kept detailed records of calls heard, etc. I can't seem to find when their calls were first issued. Do you have early callbooks?

Hi Will,

A quick check turned up the following....

1909 - Wireless Blue Book - nothing, but there were many missing from here
1914 - Wireless Blue Book - 6EA - both Seefred's, 6EB not assigned
1914 - Amateur's Handy Book (Morgan): 6EA - both Seefred's, 6EB - Charles Richardson
1914 - Dept of Commerce Stations of US: 6EA - both Seefred's, 6EB - Charles Richardson
1915 - Dept of Commerce Stations of US: 6EA - both Seefred's, 6EB - Emil Bazzini
1920 - QST Supplement, vol 3 No. 6: 6EA & 6EB not assigned
1920 - Consolidated Radio CB: 6EA - H.C.Seefred, 6EB - L.F.Seefred
1930 - Dept of Commerce Stations of US: W6EA - H.C.Seefred, W6EB - L.F.Seefred

I think I saw something written about them recently, but don't know if it was an old or new article, or on the web? My sharp tack isn't so sharp anymore, :)

Guys,

Try looking through the "Hamdom" columns in early '30s issues of QST,
they may have been written up there.

11630. Philco 48-1262 question

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2012-02-08 15:30:01 UTC
From: Captains_Z
Topic: 11630 Message: 11630

I am restoring a Philco 48-1262 AM/RP set and have a question about the built in antenna. My antenna coil winding is all jumbled up without a mounting frame. Does anyone know of how it was mounted? Probably on a cardboard sheet but what were the length and width of the mounting points to size the coil?

Thank you.

Greetings from your newest member.

I'm a longtime radio hobbyist, SWL, ham op (W8AQ) one-time DJ now radio-TV GM. A long history focused on electrons escaping from an antenna. But recently I've gotten hooked by the desire to restore a few old AM radios that take me back to my childhood. I recently bought a dozen old vintage radios from a local antique shop here in town to get the four I really want to restore...a Crosley EM-15, Motorola 5M2U, Garod 5-A2 and RCA 6-BX-63. In the deal, I picked up several old RCA, GE, Emersons and even a Zenith Cobra record player. Pretty cool. But those will likely get sold so I can focus on the four I mentioned. All are in decent shape cosmetically so recapping and replacing a few cords and parts shouldn't present too big a problem for the four radios I'm focused on.

With one exception.

I'm in need of a knob for the Crosley EM-15. I'm guessing that with the design of this cool old radio, these knobs have not all made it through the years so my search might be long and tedious. But I was wondering if anyone in this group might have suggestions as to source for this unique item? Suggestions???

Thanks for your help and I hope I can reciprocate someday.
Jack

Assuming the knob is made of molded plastic: I've had good results from greasing the surviving knob, and encasing it in silicone rubber caulking compound. After the silicone has cured, slit the mold open to remove the knob. Then fill it with acrylic two-part Fiberglass resin, colored by shooting the mixed resin with spray paint to match the original color. Then drill the casting to accept the control shaft.

There are more sophisticated ways to do this, but these are the basics.

Subject: [AWA] Hello and Help Needed from a New Member

Greetings from your newest member.

I'm a longtime radio hobbyist, SWL, ham op (W8AQ) one-time DJ now radio-TV GM. A long history focused on electrons escaping from an antenna. But recently I've gotten hooked by the desire to restore a few old AM radios that take me back to my childhood. I recently bought a dozen old vintage radios from a local antique shop here in town to get the four I really want to restore...a Crosley EM-15, Motorola 5M2U, Garod 5-A2 and RCA 6-BX-63. In the deal, I picked up several old RCA, GE, Emersons and even a Zenith Cobra record player. Pretty cool. But those will likely get sold so I can focus on the four I mentioned. All are in decent shape cosmetically so recapping and replacing a few cords and parts shouldn't present too big a problem for the four radios I'm focused on.

With one exception.

I'm in need of a knob for the Crosley EM-15. I'm guessing that with the design of this cool old radio, these knobs have not all made it through the years so my search might be long and tedious. But I was wondering if anyone in this group might have suggestions as to source for this unique item? Suggestions???

Thanks for your help and I hope I can reciprocate someday.
Jack

From: barry whittemore
Topic: 11635 Message: 11635

Well, I have been getting parts to build a TNT Transmitter. I built up a breadboard style Power supply using parts saved from a basket case old Philco. I was able to save the Socket for the 80, the Transformer and the choke.
It seems to work OK so far but the 25 watt 20K resistor was no good out of the box. it was about 450V no load and with a 5k 5watt on output it was about 220V
I liked the look of the TNT from VE7SL but i do not have at "10" but i do have a 45 and he said he made his with a 45 and switched to a 10.
I have vintage parts for all but the split resistor but can make one.

will carbon film modern resistors be OK or should i look for some carbon composites?

Thanks
Barry NF1O

Thanks Ludwell! I may very well end up making my own versions as you suggest. I'm still hoping to find a source for one (or two!) but if not will be looking to see what I can make on my own.

Thanks again!
Jack

11638. Identification of Sounder

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2012-02-13 16:57:49 UTC
From: Charles Scott
Topic: 11638 Message: 11638

All:

I picked up a telegraph sounder this past weekend and am curious if you may have more input on this unit. I haven't done anything to clean it up yet so you're seeing it exactly as I got it.

http://www.n8dnx.org/not-exactly-radio-65/

It's likely either a common configuration or a collection of parts assembled by NYRS or someone else. I would, however, like to better identify it for my collection if possible.

Thanks,

Chuck Scott - N8DNX

WU 1-( ) sounders are pretty common, but this one is unusual as to coil resistance (50 ohms) - it's usually 4 ohms for operation from a local battery or 400 ohms on "main line" sounders, where half a dozen stations ran in series on the line from a common high-voltage battery. The brass coil covers are unusual too - you'd think that, as shorted turns on the windings, they'd restrict the dot speed, analogous to old-time "slugged" slow-operating telephone relays.

The junction between coil windings seems, umm, nonoriginal.

Nice find!

Ludwell:

Thanks for your quick response on this and for some confirmation that this was a somewhat unusual unit.

I'm curious about your comment "you'd think that, as shorted turns on the windings,..." I suspect you're talking about the coil cover itself representing a "winding on the coil", which could be a problem if they were complete tubes. If you look at the right coil cover on the 4th picture (http://www.n8dnx.org/not-exactly-radio-65/) you can see that they're not complete tubes but have a 1/4" or so slot cut in them. As such there's no current induced in the cover, so I don't think there's any ill effect on performance from them.

I should probably do some tests on sensitivity and speed performance when I get a chance to see what this thing can do--out of curiosity more than anything else.

I'd be interested in any pictures or descriptions someone might have that show a typical connection between the two coils so I can return that to, umm, more original condition.

Also, I'm interested in any suggestions as to where I might be able to find parts for this, in particular the two conical feet that are missing and the third screw that's missing for the base plate.

Thanks again,

Chuck Scott - N8DNX

Topic: 11625 Message: 11650

6EB (Lyndon) wrote a story, "How to Get 50 Watts Out of a 5-Watt tube," in "Radio" for June 1923. The idea was to take a standard UV-202, remove the base, then put it upside down in a pint Mason jar filled with "Transoil." He claimed to have applied 1500 volts, synchronously rectified, at 150 mA, and gotten 3.5 amps of RF in his antenna. Running at 2000 volts gave 4.5 amps in the antenna, but the tube plate ran white-hot. I reprinted it in "Tube Collector" for last April.

"Keep those dashes short."

Ludwell Sibley

Hi Will,

A quick check turned up the following....

1909 - Wireless Blue Book - nothing, but there were many missing from here
1914 - Wireless Blue Book - 6EA - both Seefred's, 6EB not assigned
1914 - Amateur's Handy Book (Morgan): 6EA - both Seefred's, 6EB - Charles Richardson
1914 - Dept of Commerce Stations of US: 6EA - both Seefred's, 6EB - Charles Richardson
1915 - Dept of Commerce Stations of US: 6EA - both Seefred's, 6EB - Emil Bazzini
1920 - QST Supplement, vol 3 No. 6: 6EA & 6EB not assigned
1920 - Consolidated Radio CB: 6EA - H.C.Seefred, 6EB - L.F.Seefred
1930 - Dept of Commerce Stations of US: W6EA - H.C.Seefred, W6EB - L.F.Seefred

I think I saw something written about them recently, but don't know if it was an old or new article, or on the web? My sharp tack isn't so sharp anymore, :)

Hi John - I am working on an article on the Seefred brothers, 6EA and
6EB. HistorySan Jose/Perham collection has their logs and other papers going

back to before 1920. They kept detailed records of calls heard, etc.
I can't seem to find when their calls were first issued. Do you have
early callbooks?

6EB (Lyndon) wrote a story, "How to Get 50 Watts Out of a 5-Watt tube," in "Radio" for June 1923. The idea was to take a standard UV-202, remove the base, then put it upside down in a pint Mason jar filled with "Transoil." He claimed to have applied 1500 volts, synchronously rectified, at 150 mA, and gotten 3.5 amps of RF in his antenna. Running at 2000 volts gave 4.5 amps in the antenna, but the tube plate ran white-hot. I reprinted it in "Tube Collector" for last April.

"Keep those dashes short."

11653. Found: Amplion Speaker advertisement movie from 1920, story (20 minutes Youtube)

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2012-02-25 15:01:33 UTC
From: oldradio@comcast.net
Topic: 11653 Message: 11653

Hi,

I found this on Amateur Radio Newsline. It's great.

Shortcut link:
tinyurl.com/amplion

direct link:
http://www.youtube.com/watch?v=mWaZQQ2rXm0

In 1998 Frank Marshall told Trilith about a collection of old cine film that had lain under his workbench for decades. He thought that amongst them might be one film he had particularly enjoyed as a boy. It was an advertisement for an early wireless loudspeaker, the "Amplion", and had been used in local cinemas in the 1920s by his father's pioneering radio business on the Isle of Portland.

When rescued from a pile of rotting nitrate film it was discovered that the film, entitled "The Tale of the Amplion" was a hitherto unknown work by the famous illustrator William Heath Robinson. It is almost certainly the only animated cartoon that he ever made.

The tale is retold by Frank Marshall who preserved the film, Gerry Wells of the Vintage Wireless Museum in Dulwich, London and Geoffrey Beare of the William Heath Robinson Trust. Included is the film as it orginally appeared but with a specially composed musical sound track created by composer Stephen Deutsch.

This video was shot and edited by John Holman for Trilith and now appears on Transition Vision's Heritage Channel.

11677. NCX-3 restoration questions

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2012-03-05 18:08:18 UTC
From: samd65
Topic: 11677 Message: 11677

Hi,

I recently came into possessing 2 NCX-3s with one power supply. After replacing the PSU caps radio 1 seems to turn on, receive, and transmit CW (haven't hooked up a mic yet). However, since I plan to get it working at peak performance, there are a few questions I have.
1. The when unloaded the plate voltage is well over 800V, and the 280V line is somewhere around 350V. I can understand them being a little off, but that seems way wrong. Since the voltages are defined by the transformer I'm wondering how that could happen. Could the guy I got it from have switched it? The ripple on the supplies is <80mV P-P though, so at least I know the caps are working. 1 diode was also replaced.
2. There's a loud chirp when switching from RX to TX on radio 1. Is this a common issue with a quick cure?
3. Radio 2 is missing the relay. Is there an easy to find replacement?
4. What finals tubes, other than 6GJ5, are usable in the radio with the standard sockets? I do plan to maybe one day figure out how to squeeze 6146s or some other kind of tube in there, but for now the stock sockets are staying put.
5. Radio 1 has the relay mounted in the bottom of the chassis, while radio 2 has it mounted topside behind the carrier balance. However, in its place in radio 1 there is a board with a circuit on it. I haven't had time yet to trace it out yet, but it appears to be connected to the balance and mic gain. The board has 2 transistors and 2 capacitors. Any idea what the previous owner was trying to accomplish? I realize that there's very little chance of knowing with such a vague description, but it doesn't hurt to throw that in.
6. R10 has been changed in both radios from 8.2K to 4.7K, changing the bias at its most positive to -55V. Why is that? Since it causes reduced output will this make the tubes last longer?
7. Any suggestions on what other modifications I should make to the radio?

73s,

Sam
NV1P

11678. What to do with 4X150 tubes

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2012-03-05 18:22:23 UTC
From: samd65
Topic: 11678 Message: 11678

Hi all,

I went to a hamfest yesterday, and a guy was selling 2 4X150D and 2 4X150G tubes for $15. I figured even if they're weak they'd make good display pieces, so I got them. I'm in the (very) early stages of building a tube QRP amplifier around 6146s for HF and maybe 6, but might decide to build around 4X150s if they are viable. It looks like the sockets are hard to come by, and if I'm not mistaken I would need a few more voltage supplies to get them working. I should mention that I plan on using less than 1KW on the plate
I have been advised by members of my local club that the tubes were probably removed from commercial service and I shouldn't be surprised if they only put out 50% rated power, however they would very likely last quite a while the way I would be running them.
I guess what I'm asking is would it be worth building an amp around these tubes?

73s,
Sam

11679. Re: [AWA] NCX-3 restoration questions

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2012-03-05 21:53:14 UTC
From: Ralph Javins
Topic: 11677 Message: 11679

Good morning, Sam;

Look also at the other voltages as well. If everything, from the filament voltage to the
B-plus all are high, consider also that when the radio was designed and built, a more common commercial AC power line voltage was around 110 VAC. Often now my AC power line monitor is showing 123 VAC, which is notably above the current specification for a "nominal" 117 VAC power line, and it is always above. A suitable step-down transformer to get the AC supply voltage back to what the NCX-3 wants to see may be helpful.

Transformers with a plus or minus 10% "buck/boost" capability are available, and will be just about right. Having the filament voltage right for a transmitting tube is fairly important.

One result of our increased electrical power consumption is just that, the greater demand for electrical power. One way the power companies could get around the need to install larger wiring for the electrical power distribution system was to crank up the "normal" line voltage. The "KWh capacity" of the existing wiring was raised, but without any capital investment. This approach works fine with resistive loads. With inductive loads and electronics, that method may need corrective attention. Sola CVS Constant Voltage Transformers can be very useful.

Enjoy, and 73;

Ralph Javins, N7KGA
Latte Land, Washington

Topic: 11681 Message: 11681

Folks,

I bought a Delco RB-3 mini console (circa 1932)and it is being stored at the AWA museum. The plan is for me to get it on my annual trip to the AWA conference in August. This Rochester built set is in poor shape but apparently scarce enough to be worthy of restoration.

But it would be great if it could make it down here for restoration this summer. I'd be willing to pay $100 to defray expenses.

Let me know If you are in a position to help.

Thanks,
Robert

11682. Re: [AWA] What to do with 4X150 tubes

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2012-03-06 16:55:47 UTC
From: Ron Barlow
Topic: 11678 Message: 11682

Hi Sam,
 The 4x150d has a 26.5 volt heater, and fits a commonly available air system socket, such as the SK-600, SK-610, SK-620, SK-630, & others.
 The 4x150G has a 2.5 volt heater, and a coaxial base. I have never seen or heard of a separate socket, per se, for this bottle. The socket is a part of the cavity structure, in a specially designed amplifier assembly. You could probably construct a workable socket. A chimney is required to confine the air flow to the anode structure, of either of these tubes.
 Both of these tube types are designed for forced air cooling. Even if only heater power is applied, the tube's base should be supplied with cooling air. Failure to supply adequate cooling air will result in overheated seals and a profoundly shortened life span. A sizeable centrifugal blower, is required to properly cool them, although I use a small muffin fan (3") to cool such a tube, that is operating at reduced input power.
 These tubes are designed for VHF through UHF frequencies, thus their small size, considering their power capability, and although they work fb at HF, they are more difficult to put to work than an 829 or 6146, for example. Personally, I like the 829, but YMMV.
 If you see white flecks inside the tube envelope, you can probably assume that the tube is kaput.
 These tubes are very long lived, if treated properly. I have purchased many of these types, that obviously been used, and delivered full power.
 If you do wish to put these tubes to use, I suggest that you supply heater power and cooling air only, to the tube(s) for several days, before applying high voltage or drive power. The heater cathode is linked to the getter, and this step is necessary to clean up residual gas. These tubes are very old, and believe me, this step is important. I learned this fact via the school of hard knocks, and lost some (more expensive versions) tubes in the process. The failure mode is a flash over, which irreparably damages the internal structure of the tube.

Subject: [AWA] What to do with 4X150 tubes

Hi all,

I went to a hamfest yesterday, and a guy was selling 2 4X150D and 2 4X150G tubes for $15. I figured even if they're weak they'd make good display pieces, so I got them. I'm in the (very) early stages of building a tube QRP amplifier around 6146s for HF and maybe 6, but might decide to build around 4X150s if they are viable. It looks like the sockets are hard to come by, and if I'm not mistaken I would need a few more voltage supplies to get them working. I should mention that I plan on using less than 1KW on the plate
I have been advised by members of my local club that the tubes were probably removed from commercial service and I shouldn't be surprised if they only put out 50% rated power, however they would very likely last quite a while the way I would be running them.

I guess what I'm asking is would it be worth building an amp around these tubes?

73s,
Sam
NV1P

11683. NCX-3 restoration questions

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2012-03-06 17:11:09 UTC
From: Ron Barlow
Topic: 11677 Message: 11683

Hi Sam.
If you want a more commonly available or less expensive PA tube, consider the 6DQ6B, which is the octal base equal of the 6GJ5. A socket change would be required, but all else could remain the same. I used a pair of 6DQ6Bs, as RF power amps, for many years, and I was impressed with their apparent ruggedness. They seemed to be considerably more durable than some of the larger sweep tubes (6LF6, for example), that I used in RF service, as well as for their intended use, as a horizontal deflection amp.

Subject: [AWA] NCX-3 restoration questions

Hi,

I recently came into possessing 2 NCX-3s with one power supply. After replacing the PSU caps radio 1 seems to turn on, receive, and transmit CW (haven't hooked up a mic yet). However, since I plan to get it working at peak performance, there are a few questions I have.
1. The when unloaded the plate voltage is well over 800V, and the 280V line is somewhere around 350V. I can understand them being a little off, but that seems way wrong. Since the voltages are defined by the transformer I'm wondering how that could happen. Could the guy I got it from have switched it? The ripple on the supplies is <80mV P-P though, so at least I know the caps are working. 1 diode was also replaced.
2. There's a loud chirp when switching from RX to TX on radio 1. Is this a common issue with a quick cure?
3. Radio 2 is missing the relay. Is there an easy to find replacement?
4. What finals tubes, other than 6GJ5, are usable in the radio with the standard sockets? I do plan to maybe one day figure out how to squeeze 6146s or some other kind of tube in there, but for now the stock sockets are staying put.
5. Radio 1 has the relay mounted in the bottom of the chassis, while radio 2 has it mounted topside behind the carrier balance. However, in its place in radio 1 there is a board with a circuit on it. I haven't had time yet to trace it out yet, but it appears to be connected to the balance and mic gain. The board has 2 transistors and 2 capacitors. Any idea what the previous owner was trying to accomplish? I realize that there's very little chance of knowing with such a vague description, but it doesn't hurt to throw that in.
6. R10 has been changed in both radios from 8.2K to 4.7K, changing the bias at its most positive to -55V. Why is that? Since it causes reduced output will this make the tubes last longer?
7. Any suggestions on what other modifications I should make to the radio?

73s,

Sam

From: Robert Nickels
Topic: 11677 Message: 11684

Sam,

The NCX-3 was my first SSB rig and I've always had one or more around, so I'll offer a few thoughts in regard to your questions:

1. The when unloaded the plate voltage is well over 800V, and the 280V line is somewhere around 350V. I can understand them being a little off, but that seems way wrong. Since the voltages are defined by the transformer I'm wondering how that could happen. Could the guy I got it from have switched it? The ripple on the supplies is <80mV P-P though, so at least I know the caps are working. 1 diode was also replaced.

As previously noted the line voltage today is one factor, I'd also suggest making sure the choke is wired in properly in the p/s. The 800 volts on the finals is nothing to be concerned about, and while high, the 350 volts on the low B+ isn't going to create problems either. Check to see where the 6.3 volt AC filament voltage is running as an indication of what you line voltage is having, but I'm sure it will not be proportional.

I would bet that the modification in CSB-5 (see below) is installed, as this would have the effect of increasing the low B+ and might have been done if the p/s had been used with an NCX-5 at some time.

2. There's a loud chirp when switching from RX to TX on radio 1. Is this a common issue with a quick cure?

This is typical and I know of no easy fix. Google W7CPA for what he went through on his NCX-5 restoration, which I think has a similar cause. I just live with it as it's hardly noticeable in my case.

3. Radio 2 is missing the relay. Is there an easy to find replacement?

Not to my knowledge, but there are enough spares and parts rigs around you may be able to find one - check into the Boatanchors and National groups on http://mailman.qth.net/ - info on joining and access to the archives can be found there.

4. What finals tubes, other than 6GJ5, are usable in the radio with the standard sockets? I do plan to maybe one day figure out how to squeeze 6146s or some other kind of tube in there, but for now the stock sockets are staying put.

Good decision. Unlike some sweepers, the 6GJ5s are reasonably priced and available - no reason to change them. Thank National for using a final tube that no one else did, and thus are still affordable and plentiful.

5. Radio 1 has the relay mounted in the bottom of the chassis, while radio 2 has it mounted topside behind the carrier balance. However, in its place in radio 1 there is a board with a circuit on it. I haven't had time yet to trace it out yet, but it appears to be connected to the balance and mic gain. The board has 2 transistors and 2 capacitors. Any idea what the previous owner was trying to accomplish? I realize that there's very little chance of knowing with such a vague description, but it doesn't hurt to throw that in.

Sounds like a replacement relay was hacked-in to me. It might be helpful to note that the NCX-3 relay operates "backward", that is, the coil is normally energized when you're in receive mode and the relay drops out when you key the PTT. So it's common for a radio to appear completely dead if the relay (or some contacts) are not engaging to put the transceiver in receive mode. The added circuitry could have something to do with making the relay driver compatible with the new coil but that's only a guess. Treat the relay with care, obviously.

6. R10 has been changed in both radios from 8.2K to 4.7K, changing the bias at its most positive to -55V. Why is that? Since it causes reduced output will this make the tubes last longer?

Maybe someone was using a non-National power supply that didn't have sufficient range of adjustment? Again, just a guess. As long as you can set the bias properly I wouldn't worry about what the maximum range is, just adjust per the manual and you're good to go.

7. Any suggestions on what other modifications I should make to the radio?

There are five Customer Service Bulletins CSB1-5 available for free download from BAMA:

http://bama.edebris.com/manuals/national/ncx3/

You can also contact the guy who wrote them, Carl KM1H, via the above-mentioned groups where he is an active contributor. But, read and consider the value of the mods first. I don't think I've done any other than the power supply one in my current NCX-3 and it works fine.

Good luck, I obviously am an NCX-3 fan and still think it and the 5 are among the best-looking radios ever made!

73, Bob W9RAN

Copper Wire Discovered

After having dug to a depth of 10 feet last year outside of New York City , New York scientists found traces of copper cable dating back 100 years. They came to the conclusion that their ancestors already had a telephone network more than 100 years ago.Not to be outdone by the New Yorkers, in the weeks that followed, a Los Angeles , California archaeologist dug to a depth of 20 feet somewhere just outside Oceanside . Shortly after, a story in the LA Times read: " California archaeologists report a finding of 200 year old copper cable, have concluded that their ancestors already had an advanced high-tech communications network a hundred years earlier than the New Yorkers."

One week later, a local newspaper in Burwell , Nebraska reported the following: "After digging down about 30 feet deep in his pasture near the community of Elyria , Nebraska , Stanley Kolwaski, a self-taught archaeologist, reported that he found absolutely nothing. Stanley has therefore concluded that 300 years ago, Nebraska had already gone wireless".

I'm going to be restoring a Millen 90711 VFO that I bought from John Dilks last Fall. I would like to find the original coupler unit that plugs into the transmitter. The coupler is a tuned circuit at the end of some coax, 20m, 40m, 80m band switch on it, plugs into the transmitter crystal socket. I've put some pictures of it up on photobucket.com here:

http://s1140.photobucket.com/albums/n571/651daisy/Millen%2090711%20VFO%20Remote%20COUPLER/

Pictures are courtesy of my buddy Don N9OO. If I can't find one, then I'll simply build one but I'm checking with the lists first. Yes I did check with Ralph from Millen but he reported back that they don't have any of these materials. I intend to use the Milllen VFO and coupler with my 1935 Gross CP-100 transmitter and NC-101X station.

Presentation: "Blonder Tongue Agile Modulator" by Dave Cavey

The Mid-Atlantic Antique Radio Club (MAARC) is a hobby club for those dedicated to collecting, restoring, and preserving vintage radio and television equipment. Collecting antique radio equipment is a fun and interesting past time that appeals to a variety of folks from the pure collectors who are looking for their next great find, to the technicians and tinkerers who like to restore the electronics or refinish cabinets, to the historians and preservationists interested in the history of the technology, to those who are into it as a small business. Many involved dabble in several of these areas. All enjoy the comeraderie of a shared interest. You will find radio collectors to be a friendly and honest group who does not take themselves too seriously, while recognizing they are preserving a part of our heritage.

11725. Atwater-Kent Breadboard

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2012-04-11 20:36:00 UTC
From: R.T.Liddy
Topic: 11725 Message: 11725

Hi Group,

I have an Atwater-Kent Breadboard Radio, but don't know the actual model number. Pictures I see on the internet lead me to believe it is a Model 10 of some kind or mavbe a 4340.

How can I tell? Can I send a picture of it here?

I'll probably sell it at the Dayton Hamvention, but not knowing the Model, I have no idea what it's worth.

Any suggestions?

TNX,   Bob K8BL

11726. K2TQN Presentation: Titanic, the Sinking and Rescue: Who was the real hero of the rescue?

K2TQN Presentation: Titanic, the Sinking and Rescue: Who was the real hero of the rescue?

The presentation will include an actual 1912 Newsreel about the disaster.

Hello gang,

Tonight I'm giving my Titanic talk at the New Jersey Antique Radio Club (NJARC) meeting at Infoage in Wall twp., 7:30pm. If you can make it, I'd love to see you. (Enter through the NJARC Museum, behind the Marconi Hotel.)

Directions: http://infoage.org/visit

If you can't make it, you should be able to see it VIA Ustream from this web page, if everything at the meeting is working OK.

In going through some old tubes, I came across a WD-11 and a C-299, both with filament continuity.
There is also a pretty 26, globe that tests marginal on my TV-7D.

Can anyone give me an idea of the value of these, and/or interested in acquiring them. I don't
expect to buy a new Bentley with the proceeds, but I also don't want to have someone offer similar
ones to me for $150 each!

@Vintage carillon to ring in troubled KC area

Source: AP Alert - Missouri
Date: April 09, 2012
BC-MO Bells of Peace, 1st Ld-Writethru
Eds: Updates with history of carillon, efforts to restore, quotes
KANSAS CITY, Mo. -- A vintage electronic carillon known as the Bells of Peace could soon be ringing in one of Kansas City most troubled areas. The collection of 405 brass rods played from a keyboard was a gift from Joyce C. Hall, the founder of Hallmark, and it first rang when the Liberty Memorial in Kansas City was rededicated in 1961.
Now, volunteers are installing the carillon (pronounced kuh-RILL'-ee-uhn) at St. Therese Little Flower Church in the 64130 ZIP code, which The Kansas City Star (http://bit.ly/Hpp4HC) reported last year had more convicted murderers than any other ZIP code in the state. St. Therese Little Flower has not had a bell since it was built in 1948. The church's pastor, Rev. Ernie Davis, said he hopes the carillon will bring hope to the area and lure visitors across Troost Avenue, long the dividing line between white and black neighborhoods in the city.
"I don't know if you could do a scientific experiment to prove something like the bells could have an impact," Davis said. "But I can imagine that for someone losing hope or for someone with a gun in his pocket, this might save a life."
This electronic carillon includes long brass rods in metal cabinets: four tall ones on the floor and five smaller cases hanging on the wall in the church basement. The rods are struck and amplified with the help of vacuum tube technology, low-voltage currents and wiring.
"The idea is to play the minor bells against the huskier bells, the big stuff," said Bruce Prince-Joseph, St. Therese's organist and artist-in-residence.
Prince-Joseph was the keyboardist for the New York Philharmonic for more than two decades. He and the Rev. Jeff Hon, pastor of New Song Church in north Kansas City, have helped save the carillon twice.
The carillon rang from the Liberty Memorial for about 15 years before it fell into disrepair. Prince-Joseph became aware of carillon in the early 1990s, when memorial officials were ready to discard most of it. For two years, Prince-Joseph and others worked to install the carillon at St. Mary's Episcopal Church in downtown Kansas City, where he was music director.
Many replacement parts were hard to find and most of the wiring plans had been lost. A St. Mary's member, Richard McDonald, was experienced in tube electronics and got the carillon ringing again in 1994, and for the next 15 years, across downtown.
About two years ago, the St. Mary's underwent renovations and the

carillon was taken out of service. Prince-Joseph, Hon and others decided to move the carillon to St. Therese.
A few months into the installation at St. Therese, McDonald died. Hon is trying to complete the work, with the help of electrical engineer Brian Haupt.
Several of the bells refuse to ring, and it's unclear why. Hon is looking for advice from anyone with experience in vacuum tube and amplification technology from the 1950s and '60s. The pastor is confident that the problems will be resolved.
"I think that St. Therese _ not the church, but the saint _ is interested," Davis said. "I think she's pulling strings."

Wow. Not in Rider's, not in Bunis, not in McMahon (any volume), not in Ghirardi. We're talking seriously obscure.

Is there a nameplate on the chassis? Sometimes one can trace an odd set to a private-brand maker like Wells-Gardner by markings like "Factory No. 1" on the plate.

Fine cabinet design!

A quick check of the net showed that Fred Stein made Steinite radios. Your radio is almost identical to the Aztec cathedral made by Stein..

Nice set. The tube line-up would suggest a date of around 1929.

“Stein”! Sure enough. There’s an eight-page article on Steinite Laboratories / Fred Stein in Vol. 3 of Douglas’ “Radio Manufacturers of the 1920s.” He says “Steinite reorganized again in October 1930 intending to make private-brand radios and lasted another two years before disappearing.” That focuses the vintage of your radio somewhat.

There are four Steinite chasses in Rider’s Vol. 2 that are probably close to, or equal to, your set.

FYI......

I'll be selling an Atwater-Kent Model 10 and matching Speaker
at the Dayton Hamvention May 18 & 19. It has a battery eliminator
AC Supply included. Picture attached.

You can find me in Space 1540 in the Fleamarket.

11758. QRZ.com app is available on the Amazon Kindle Fire = potential problem

Hi gang,

QRZ.com recently released an app through Google to allow access of their database through Android equipped devices. I was bummed out as Google would not download to my Kindle Fire.

Today I saw on the QRZ forum that it was available through Amazon's app store for the Kindle.

Great! not so fast... I couldn't download it from Amazon due to a forgotten "Parental Control" password.

All of sudden everything on my Kindle was password protected.

My son found this....

"Amazon issued a software update for its Kindle Fire tablet this week that adds password protection and other parental controls.

Software update 6.3.1 "brings additional parental controls to Kindle Fire, including the ability to password-protect purchases, disable access to specific content libraries, and block access to the Silk Web browser," according to Amazon.

The option was a key feature missing from the tablet when it debuted in November, and is a welcome addition to those who don't want their kids surfing to adult content or charging apps, movies, or other content to their accounts.

Silk is a "split browser" that partially lives on the Fire tablet and partially lives in the cloud, producing a faster browsing experience. Basically, most of the heavy lifting is handled by Amazon's EC2 and C3 services. As PCMag's ExtremeTech described it, "Amazon sucks down the target Web site, lays it out, renders it—and then ships it off as a much smaller, condensed package to the Kindle Fire tablet."

The update will be automatically delivered to the Kindle Fire,....."

Well Howdy Doody Buffalo Bob!

It turns out I tried to password protect the Kindle a couple of months ago, and since it wasn't working I had forgotten that I did that. The update this week put it into effect. After a while, trying several old passwords, I found one that worked.

I'll bet lots of Amazon kindles are now password protected and are wreaking havoc for the owners.

Now my [free] QRZ.com app is loaded and working flawlessly.

... I thought I'd share this with you, FWIW.

With internet access on phones and others why not just type in the web address?

Sent from my Samsung smartphone on AT&T

Hello,
I uploaded a picture of an old Philips 796A radio dial in the Photos section.
The radio has an AM1 magic eye, which I moved in the picture from the left side to the top.
Can be used for a desktop back round image.

11766. Oldest continuous hamfest looking for Montana Ham Radio History

Hello all!

I'm still looking for anyone, anywhere, who might have hamfest history of the Glacier-Waterton International Peace Park Hamfest. I'm also looking for any Montana Amateur radio history too! If anyone can help out, I'd love to hear from you! I'm looking for ANYTHING related to Montana Amateur radio. If you have old QSL cards from Montana, I'd love to get a scan of it from you to add to our collection.

If you'd like to see the 2009 75th anniversary documentary video I made of the hamfest, goto this youtube web page and watch the 4 part video about the hamfest.

http://www.youtube.com/watch?v=GRU_TFMz4i4

The Glacier-Waterton Hamfest is coming up this July! If you can make it, we'd love to see you! It takes place at the southern tip of Glacier National Park and is a GREAT hamfest to attend set deep within probally one of the most beautiful places on earth! Just ask John Dilks, K2TQN if he had a good time last year? :) [I did, it was great!, K2TQN]

If you have any questions, drop me a email, I'd love to hear from you!

Saving eBay photographs is a browser-specific issue. I've found that MS Internet Explorer will save photos, but FireFox won't. Opera usually always works, and Safari does too, but Chrome won't. At least that's the way I remember it. Try right-clicking with a different browser.

It's also a photo-type specific issue. Some can be copied by merely right-clicking and 'Save As'.

You can ALWAYS do a 'screen grab', regardless of photo type.

I was referring to photographs hosted by eBay servers.

If the auction photos are hosted by another service, there are other
ways to copy the photographs such as digging them out of the browser's
cache, or finding the photo's direct URL by viewing the source code.

A screen grab is a last resort. :-)

Ron, if you wanted the page text and the photos, maybe you install a PDF printer such as PDFcreator from PDFforge. Using either IE 8-9 or Firefox, you should be able to tweak margins or scaling to get a useable layout.

With a PDF editor, you could also add larger-resolution versions of the photos if you had them.

11777. Request For Assistance: MWTCo 1912 Wavemeter Restoration

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2012-05-24 15:38:47 UTC
From: Larry Dighera
Topic: 11770 Message: 11777

I have recently acquired a Marconi Wireless Telegraph Co. wavemeter sold as circa 1912. My research <http://www.mhs.ox.ac.uk/advanced-search/> has yielded absolutely nothing about this instrument.

Jim Kreuzer says he has one like it on display in the Titanic diorama, and that they were made in both England and America, and that it is English circa 1912 - 1914. I've been told by an very knowledgeable friend in GB that the little arrows scratched on the knob and panel are typical of WW-I (began on 28 July 1914 wireless and lasted until 11 November 1918). If correct, that might place it a little more recent than 1912.

I am keen to find:

* A photograph of the proper crystal detector (currently replaced with a Formo <http://www.ebay.com/itm/160782935519>), so that I may fabricate an authentic replacement. Indeed, I'm not sure if the original was galena or carborundum.

* The wavemeter's model number

* The approximate date of manufacture.

* Any other historic information about this type of wavemeter.

The whole search for the proper detector saga (including a drawing of the mounting holes) is documented here: http://www.antiqueradios.com/forums/viewtopic.php?f=6&t=191384&p=1596122#p1596122

Any insight into what the original detector mount was like is most appreciated.

Thank you in advance for assisting with the restoration of this historic piece of wireless apparatus.

The "broad arrow", as it's commonly called, has been placed on
government property in Britain since the 1500s and its use continued
long beyond WWI, so it's not a very helpful dating tool:

Many thank for that information, Bill. Here's a quote from the link
you provided:

The Board of Ordnance in 1597, its principal duties being to
supply guns, ammunition, stores and equipment to the King's Navy,
used the broad arrow to signify at first objects purchased from
the monarch's money and later to indicate government property
since at least the 17th century. The broad arrow frequently
appeared on military boxes and equipment ... With the demise of
the Board in 1855, the War Department and today's Ministry of
Defense continued to use the mark.

So it would appear that the broad arrow marks are not indicative of
the age of this piece.

Hello Mike,

Thank you for your response. I know your collection is legendary, and
very much appreciate your knowledgeable input in assisting me to
determine the correct crystal detector for this wavemeter.

You'll find five photographs of the wavemeter at the beginning of this
thread:
http://www.antiqueradios.com/forums/viewtopic.php?f=6&t=191384&p=1596122#p1596122

I found two pair of original mounting holes in the panel where each
end of the original crystal holder had been originally fitted. So far,
I've not been able to find any MWTCo detectors that require four holes
in the panel.

If historical accuracy is important in restoring this example of one
of the first pieces of electronic apparatus ever made, then I think it
deserves further research. Or is that just pedantic? :-)

Larry -

Well, thanks for the kind words, but, my collection is far from legendary, especially now. However, I have been acquiring new additions on a regular basis. While I will never be able to replace some of the nicer items, I am managing to obtain enough to keep me happy.

Ironically, as it turns out, the wavemeter I have is the same as yours, with the exception of course that mine does have the original detector. I will take some photos later and email them to you direct, as I do not believe this reflector accepts attachments. I also believe this is the one that is scarcer than the more common one with the space for the headphones in it. A photo of that one can be found on page 82 of the AWA review #9 (1995) written by Jim Kreuzer. I believe ours is the same vintage, or, possibly earlier, so, the 1912 is not far off in my opinion. Actually, I believe it is earlier.

Wonder what the number on the circular tag above the Marconi plate on your is. On mine it is 56. Regards - Mike

I found two pair of original mounting holes in the panel where each end of the original crystal holder had been originally fitted. So far, I've not been able to find any MWTCo detectors that require four holes in the panel.

If historical accuracy is important in restoring this example of one of the first pieces of electronic apparatus ever made, then I think it deserves further research. Or is that just pedantic? :-)

Larry -

I just noticed the other photos below yours. I do not need to send you photos as that is my unit J. Wonder how the photos got there? I more than likely bought it off of eBay, although I believe a seller offered it to me directly from Australia. Regards - Mike

Subject: Re: [AWA] Request For Assistance: MWTCo 1912 Wavemeter Restoration

Hello Mike,

Thank you for your response. I know your collection is legendary, and very much appreciate your knowledgeable input in assisting me to determine the correct crystal detector for this wavemeter.

You'll find five photographs of the wavemeter at the beginning of this thread:
http://www.antiqueradios.com/forums/viewtopic.php?f=6
<http://www.antiqueradios.com/forums/viewtopic.php?f=6&t=191384&p=1596122#p1596122> &t=191384&p=1596122#p1596122

I found two pair of original mounting holes in the panel where each end of the original crystal holder had been originally fitted. So far, I've not been able to find any MWTCo detectors that require four holes in the panel.

If historical accuracy is important in restoring this example of one of the first pieces of electronic apparatus ever made, then I think it deserves further research. Or is that just pedantic? :-)

I asked my collecting friends in England if they could add to what you have found already, and received this:

"I presume the calibration data covers the range 130-800 metres... I don't think this one is the dual range variety. The cat's whisker crystal detector is dead wrong - the original would have been a carborundum detector and the small hole under the cats whisker mount suggests a modification has been made. When switched to the buzzer the system functions as a low power transmitter for tuning a nearby receiver and when the crystal is switched in it operates as a conventional detector receiver for measuring wavelength of an incoming signal. A lamp was sometimes used but I don't think this model would ever have had one - A few notes and circuit diagrams for this type of wavemeter are to be found in Rupert Stanley's Wireless Telegraphy (1917) and Hawkhead and Dowsett's Handbook of Technical Instruction for Wireless Telegraphists (1925)."

The Stanley book can be read at Google:

One of my Swedish friends has almost enough parts to assemble an "AK 3" breadboard. He is asking if anyone is still making high quality reproduction boards...

A guy in PA was doing great work maybe 15 years ago, but I just cannot think of his name...

As a backup, he wonders if anyone could provide highly accurate dimensions and specific information on the wood used...

Any leads would be appreciated...

Professor Jack's wavemeter is indeed very similar to mine, perhaps more so than any of the others I come upon yet. There are some notable differences however:

1. There is an additional three position switch with roller.

2. It only has one set of screw terminals on the panel, with a second pare mounted on the front.

3. It lacks the plastic pushbutton on the front to energize the buzzer.

So I do believe they are close in age. But we still don't know the age of either of them, nor the model numbers.

From: Ludwell Sibley
Topic: 11792 Message: 11792

I have eight "banker boxes" of Photofacts, of "tube" vintage, from 1946 through about 1961, which are surplus. I want to get at least some of them to a "good home" on a free-but-you-pay-the-shipping basis. (Or pick them up in southern Oregon.) They aren't a complete set but are obviously voluminous. They have been stored under dry conditions and are in good shape.

I would be interested in the following "deals":

Get the whole set or

Get just the "radio" folders or just the "TV" folders or

Get selected folders as gapfillers or to accompany gear in your collection - just advise the set and folder numbers.

A few of the early paper indexes are available - these save time in looking up vintage equipment because they aren't cluttered with modern stuff.

I know this is the Internet Age and a lot of this material is available as downloads, but these are the Real Thing.

Please email me directly if interested.

Wavemeter No. 59180 is rumored to be one used by professor Robert Jack
who broadcast New Zealand's first radio program November 17, 1921. If
true, your wavemeter has historical significance beyond its being an
example of early electronic apparatus.

You can read Professor Jack's biography here:
http://www.teara.govt.nz/en/biographies/4j1/1

An interesting bit of information Larry. As I initially said, I thought I obtained it from Australia, however, it could just as easily have come from New Zealand. I really do not remember now.

I looked through my 1912 vintage MWTC of America catalog, in which everything offered was still made in the UK. In it, it only shows the wavemeter with the earphone compartment on the left side. Seems to me it would be a simple matter for you to make the original crystal holders. If you need close-up photos and dimension let me know. Regards - Mike

Mike,

Yes. I believe you have a very historically significant wavemeter worthy of further research. As I recall, there is a lot of information on-line, including the circumstances regarding the NZ school's decision to auction Professor Jack's items.

Thank you very much for your kind offer to provide dimensions of the crystal holder fitted to your wavemeter. I've been thinking some more about the four detector holder mounting holes issue. And given the design of the two vertical strip crystal holder, it is entirely possible that the additional holes were provided for adjustment purposes to accommodate larger or smaller chunks of galena or Carborundum. (I presume Carborundum was originally used, as it would seem that a cat's whisker might be required for galena.) So, if it is not too much trouble, is it possible that you might check the underside of the panel of your wavemeter to see if there may be four holes also? In any event, the dimensions and photos you offered will be welcome. Thank you. Have you any way to measure the thickness of the brass strips? Do they appear to be nickel plated?

Incidentally, K7KSW has added information about his Marconi Wireless Telegraph Co of America wavemeter and also the wavemeter with headphones compartment at the bottom of the Antique Radios Forum page:
<http://www.antiqueradios.com/forums/viewtopic.php?f=6&t=191384&p=1623587#p1623587>

Antique radio folks are terrific!

While this new transistor apparently exploits the speed of thermonic
emission, it's hardly a vacuum tube.

In semiconductors electron speed is limited to about 500 km (310
miles) per second, but in the vacuum they could travel at almost
the speed of light - 600 times as fast.

This new technology could be used for sensing hazardous chemicals,
noninvasive medical diagnostics, high-speed telecommunications, as
well as in extreme environment military and space applications.

http://apl.aip.org/resource/1/applab/v100/i21/p213505_s1?isAuthorized=no
A gate-insulated vacuum channel transistor was fabricated using
standard silicon semiconductor processing. Advantages of the vacuum
tube and transistor are combined here by nanofabrication. A
photoresist ashing technique enabled the nanogap separation of the
emitter and the collector, thus allowing operation at less than 10 V.
A cut-off frequency fT of 0.46 THz has been obtained. The nanoscale
vacuum tubes can provide high frequency/power output while satisfying
the metrics of lightness, cost, lifetime, and stability at harsh
conditions, and the operation voltage can be decreased comparable to
the modern semiconductor devices.

A photo of the calibration table is here:
http://www.antiqueradios.com/forums/download/file.php?id=19130
It appears to cover the range from 134 to 1426 meters. However, as
there are only two wires leading from the coil, I believe it is safe
to say it covers but a single range.

I believe the former statement is accurate, however I am unsure of how
to know if the four holes in the panel associated with the crystal
detector mount are original or a later modification. There precision
suggests to me that they are probably original.

Yep.

Alan Douglas offered this bit of history:

Marconi I'm pretty sure never used galena, and I believe always
used adjustable bias with carborundum. I'm out of range of
reference material here at work, but cerusite rings a bell as
Marconi's favored detector when bias wasn't available.

Of course owners could use whatever they liked, and Marconi ship
operators could carry their own pet minerals with them, for use as
soon as they were out of sight of supervisors.

It just amazes me how so much can be accomplished by a knowledgeable
and sincere community of like-minded "brother's of the spark" so to
speak. Thank you very much for your help.

http://dictionary.reference.com/browse/cerusite

http://franklin-sterlinghill.com/palache/cerusite.stm
Cerusite forms clear white or gray crystals encrusting galena. It
was found as a scarce alteration product of galena at Sterling
Hill. The measured crystals, collected there in 1905, are
prismatic parallel to the brachyaxis (figure 63), with a richly
developed zone of brachydomes. Others are twinned in the ordinary
cerusite habits.

I just received two AWA list posts from "w3rlw at mail.com" with links to: "woman.html" ({AWA}) and "deal.html" ([CC-AWA]); no other info.

Of course I didn't click on them since they match the usual spyware-virus traps. However I haven't received anything else from AWA since 6/8 [AWA} and 6/10 [CC-AWA].

What happened to the list?

11815. NOS RD-7B/APA-23 automatic radar data recorder contract date 1945

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2012-06-21 22:08:28 UTC
From: Jack
Topic: 11815 Message: 11815

I picked up this amazing gizmo recently. It was used in association with airborne radar surveillance receivers APR-1-APR-5 to automatically log the frequency & acquisition time of radar signals. When a signal was received, a drum covered with chemically-coated paper would begin turning on a worm gear & a metal stylus would convert electrical current into marks on the paper. This kind of system was used in FAX machines well into the 1970s. After the mission the marks on the paper could be correlated with the location & frequency of both friendly & enemy radar sets.

I am looking for any manual or other documentation for AN/APA-23.

Thanks!

Jack

There was a manual in the original shipping box, Jack. I might have a spare, will need to look in the storage area. Be aware that the X axis drive is derived from an unobtanium geared tuning head, the MX-232A/APA-23, that is mounted on the front of whatever receiver you wish to use. A calibration chart then has to be constructed that relates dial position to frequency, so that the Y axis will correlate to the signals received on a given frequency as the receiver is swept through a band. I think they cite several potential receivers, including a BC348!

Be aware that an interest in the WWII countermeasures equipment is a slippery slope... :-)

Very 73,
Mike KC4TOS

Mine is at http://aafradio.org/countermeasures/APA-23.jpg

There is a significant amount of setup and calibration required of these recorders for a mission, especially if you are going to swap receivers.

Well, I for one sent the two of mine personally and with forethought, subject line was about the APA-23 thermal paper recorder used for WWII countermeasures work, and I don't have a yahoo e-mail account. Hijacked account e-mails are usually easy to spot, with either no subject or a subject line that has ambiguous relevance to our interest area, like, "Take a look at this!". In addition, the body usually has no amplifying prose - just a link. It's one reason I always try to add a sentence or two to any link I provide to explain what it is about. If that prose makes no sense, then there is something wrong.

Jack and w0eom notes seem okay as well.

July 10

Maine: Wireless North Pole Presentation about the Schooner Bowdoin and Don Mix's 1923 expedition.

https://firstclass.mma.edu/mmacalendars/fav1-0001a144/S08B703B5-08B7053F?VF=-1

John Dilks a radio historian and author, will make a presentation entitled, "WNP, Don Mix at the North Pole," on Tuesday, July 10, 2012, at 7:30 p.m.,at the Castine Historical Society. The presentation will be held in the Mitchell Room located on the lower level of the Abbott School on the Town Common. The presentation will be free of charge and open to the public.

The Maine Maritime Academy in Castine is the home port of the Schooner Bowdoin.

The Schooner Bowdoin was built during the winter of 1920-21 for the famed Arctic explorer Donald B. MacMillan, and launched from Hodgdon Brothers Shipyard in East Boothbay, Maine. At 88 feet long, 21 feet wide, and weighing 66 tons, the Bowdoin is the smallest vessel designed expressly for Arctic work. In 1921-22, the design of the ship proved to be perfect for MacMillan’s Arctic work, and he sailed the Bowdoin more than 300,000 miles over 26 voyages through the frozen North in exploration and scientific studies. The Bowdoin was completely rebuilt in 1980-84 by Maine Maritime Museum’s boatshop, Percy & Small Shipyard. It has been the official state vessel of Maine since 1988.

July test of SAQ

11823. "That's Why God Made The Radio" / The Beach Boys

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2012-07-01 17:01:16 UTC
From: John Casale
Topic: 11823 Message: 11823

I thought I would take this opportunity during a lull on the list to pass along something that might be of interest...

Not sure if you are aware, but there is some new music that was recently introduced by The Beach Boys with a radio theme titled, "That's Why God Made The Radio."
The title track of the album is an old fashioned rock n' roll song that reminisces about a simpler time of just listening to the radio in your car on a summer's night.
The song includes lyrics like:
"Tuning in the latest star; From the dashboard of my car; Cruisin' at 7
Push button heaven; Capturing memories from afar; In my car...
Feel the music in the air; Find a song to take us there; It's paradise when I lift up my antenna
Receiving your signal like a prayer;.....That's Why God Made The Radio."

There are few artists these days introducing new music referencing the radio, let alone anything
that really resembles music. I had the opportunity to see The Beach Boys in concert last week at
Saratoga, NY. They are doing a world-wide tour celebrating their 50th anniversary.
They are probably the hardest working "70 year olds" in the music business--they performed 48 songs that night. Their new album has their typical up-beat songs about the summer, beach and ocean
but there are several cuts written by founding member, Brian Wilson that are very reflective in nature from
any senior's perspective. The album is apparently striking a chord with others too--
It debuted at # 3 on Amazon's top 100 on June 12th and today it is still in the top ten.

73, John W2NI

From: Christian R. Fandt
Topic: 11825 Message: 11825

Good evening list,

To finish a restoration on a United American Bosch model 505 chassis I am looking to find a functional dynamic speaker assembly including output transformer.

Of course, the field coil and output transformer should be okay and the cone intact. All three strikes are against the one on this chassis! Anybody got a parts chassis?

Thanks much!
-Chris F.

Anyone have a high quality scan of Radiola 26 Users Manual? (Not service notes...)

I found a copyright overlay scan on the web.

I need a high quality scan to print in ANTIQUE RADIO.

Thanks,
Robert

11829. AWA 2012 Convention

So who's going to the convention this year? It's only a few weeks away, and the program schedule and other details are on the website, but Roy has not done the constantly updated count of attendees and flea market spaces this year and there's no recent news:

http://awamuseum.org/

I'll be there; Tom Perera has asked me to do another talk for his Key & Telegraph Seminar on Thursday - now all I need is a topic...

Well, for the 39th time in 40 years I'll drive 700+ miles each way to be there for the full 5 days of programming.

To the best of my knowledge, this conference still provides the strongest package of historical lectures & demonstrations, talks on conservation & restoration techniques relevant to communications technology held annually in the USA. Mix with that an outstanding opportunity to see and learn about significant artifacts, acquire new goodies in an improving fleamarket & auctions AND last but not least; to meet old friends and hopefully get the chance to meet a few new folks as well..... I can't think of a better vintage communications enthusiasts deal for 2012...

Hello Steve

Apparently you didn't get my personal reply to your query earlier today and are trying again via th ereflector.

So following is a replay of my earlier answer. answer.

Hi Steve--

First let me do a bit of troubleshootring. Our current (July) isssue won't be mailed out until tomorrow. And, since we now mail by non profit rate, it will take several days to reach you.

The other thing is that we do not use plastic bags--though the post office might use a bag to hold the shreds of a destroyed issue.

Are you sure you have an AWA mailing there? Is there enough left that you can definitely see our logo and maybe a date. If so, perhaps you have the remains of an April issue. Check your files to see if you have that one, then contact me again.

Cordially,

Marc Ellis

My REVIEW was delivered today - just. The plastic bag was torn completely open at one end and half open at the other. The book was a bit ragged around the edges, but at least it and the address label managed to arrive together.

The plastic bag seems far too flimsy for the weight of the REVIEW.

I'll ad my congratulations to the new AWA Review. You have set a new bar for future issues to match. It's really great.

I especially like the Titanic article by Eric Wenaas and Parks Stephenson. Parks' illustrations along with Eric's excellent writing will be a pleasure to read and re-read. This is the most comprehensive article on the Titanic's radio room I have ever seen.

Shipping: Mine arrived intact and in perfect shape - but the plastic envelope was torn along the top edge of the Review. The sharp edge of the cut paper was enough to start tearing. I would suggest for future issues, the printer use a more durable plastic, one which won't easily tear.

And a special thank you to whoever paid for my copy (again).

....OK, back to reading my Review now.

11862. NEW MUSEUM. HAVE YOU MADE A DONATION ? A MODEST PROPOSAL....

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2012-07-29 03:08:08 UTC
From: Roy Wildermuth
Topic: 9431 Message: 11862

am writing this as a fellow member of the AWA not in any official capacity. The opinions expressed are strictly my own.

Every week I am impressed by the volunteers at The AWA Museum. They all work their butts off getting this New First Line Museum together. I realize a lot of you have not been able to make the trip to Rochester to see the progress on the endeavor. The amount of work that has been put into this is really impressive. But they can not do it alone. The adverse economic conditions have hit everyone hard and The AWA has not been immune. The success of the New Museum is not just dependent on hard work by volunteers. Donations are needed as well. The AWA is a unique organization and the Museum promises to be a unique entity in that a major portion of it's knowledge base has been provided by members of The AWA itself. In many ways, we not only conserve and display history, we have participated in history.

My wife and I have donated to the Museum because we believe in it and I am asking you all to consider making a gift yourself. I want to make sure that not only the artifacts but also our own knowledge base, such as the AWA Review, are available to future generations.

In the past, we always had to pay for the Review. Most of us did without reservation, Now,it is free. Because someone has made a donation. Why not consider sending that $20.00 to The AWA Museum Development fund.

Hi Folks,

I jackpotted a Speciality Radio Manufacturing Company Type 1095 forestry radio at the Centralia WA Hamfest last weekend.
It appears to be in good shape, less crystals, but I can't find any information on it.
The company was located in Portland, Oregon.
The radio was USFS marked, and stenciled "Humboldt", presumably for the Humboldt NF.
It was also Dymo labeled at a later point indicating operation in SW Washington.
Various dates from 1949 and 1951 were found on the chassis.
The radio uses 1 & 3 volt tubes.
I'm suspecting it may have been surplused direct, or possibly to the Washington Department of Forestry, which became the Department of Natural Resources about 1959.
Any information (especially a schematic and frequencies of operation!) would be greatly appreciated.
Thanks in advance,

-Tom Herman, PhD N1BEC/7

Tom,

There is a fellow who checks into the West Coast 40 meter swap net on 7.240 who is always putting out a wanted requests on these radios. I don't know his call, but if you check into the net Sat or Sun, net control will know who he is. Net starts at 12:30 PM PST

I would assume he could give you plenty of info.

Craig

Hi Tom,

Please let me know what you find out.

I have a “STATE OF WASHINGTON DIV. OF FORESTRY TYPE FL-1 SERIAL NO 55” it is “MFG. BY OREGON ELECTRONIC MFG. CO. PORTLAND OREGON U.S.A.”. It is 2 channel crystal controlled. There are 4 crystal sockets with only 2 installed, made by PR, 11.020 and 15.730. There are 14 tubes, 9 ea. 1U4, 3 ea. 3A5, 1 ea. 1T4, and 1 ea. 3V4.

I have not other information and haven’t found the time to try to figure out a schematic for it.

73,

From what I understand, it's just the UV component. I installed a film similar to that used on car windows on our south facing windows to stop the UV, and voila, no more faded rugs or furniture. Oh...you'll probably have to take out the UV disco party lights in your new room as well, but you can't have everything...

If you renewed your AWA membership with your 2012 Convention Registration and DID NOT receive your Journal or Review it is possible that we did not get the information from The Convention office to Membership. Although we try and prevent this, it does sometimes happen. If this is the case please email me at w2it@.... This is easily rectified. And if this did happen to you, I sincerely apologize.

From: Roy Wildermuth
Topic: 11874 Message: 11874

Watch your mail.

Your ticket to the AWA Convention is on it's way ! And if you have not registered, there is still plenty of time. Although we are not going to mail materials after August 19, you will still be able to pick up your credentials at RIT. If you pre-register and we do not mail your credentials, and you are a guest at RIT, it will be at the RIT desk.

Remember that spouse credentials are mailed under separate cover. So if two of you are coming there will be two envelopes mailed.

Well, nuts. I didn't get a huge reception to my offer, so all the Photofacts have gone to the Great Paper Mill in the Sky.

The bright part is that I don't think I could have filled any of your current wants. You and I attacked that problem from the same collection a couple of years ago, and it yielded a couple of banker boxes worth of needed stuff.

Lud

Thanks for getting back to me. Last year's flood made a decision for me on what to do with the manuals above 1000. I managed to dry out the lower ones that got wet and discarded all the TV stuff above 1000, but I still have 4 or 5 full file cabinets. My wife was hoping it would all go. What I couldn't save was the Philco docs that were on shiny paper. That all just stuck together like it was glued.

11879. Bruce Kelly 1929 QSO Party 160 Meter Band Question

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2012-08-10 17:45:23 UTC
From: whitebear1122@comcast.net
Topic: 11879 Message: 11879

Guys, I am writing up the article for the upcoming Bruce Kelly 1929 QSO Party in December. This year the event is adding 1 60 meters to the line up. For the article I need to state the range. Eddy suggested I start with the Linc Cundall range of 1800 to 1820 and possibly expand it.

I've heard there is a DX window down there somewhere and I don't know what other 'gentlemens agreements'. Is the Linc Cundall 1800 to 1820 Kcs adequate? Can I run with that?

For 40 meters this year we're listing the entire Novice band of 7100 to 7125. Last year we had specified a smaller range in the Novice band and it was jammed with 29 signals. Many people asked if we could expand the range to include the whole Novice band. Yes, so I will reflect that as well in the upcoming article .

Probably. The DX window is 1825-1830, unless some modern changes
have been made.

Topic: 11879 Message: 11881

I think we should not go any higher than 1820 and perhaps even suggest 1810 as the 'watering hole'. At that time of the year, there is often CW DX right down towards 1815-1820 although it usually stays higher in the band. As well, it should be easier to find those weak '29 ers and their improvised 160m antennas if we concentrate in a smaller region.

I'm not even sure of the dates for this year as the AWA has seen fit to remove all references to Amateur Radio operating events from their website...nice one guys!

In any event, the first weekend may conflict with the ARRL 160m contest unless things have changed so you may wish to confirm if this is the case. If so, I would further suggest that any BK topband activity take place on the second weekend only.

Closer to contest time, we might also discuss perhaps meeting on 160 at a certain time slot as I'm sure many BK ops will be reluctant to leave 80 or 40m activities for too long....so a short QSY to the 160m operating window when we know that chances are optimized, might work out well. I really hope that there is good support on 160 for the BK.

For those needing coil data, there is some great stuff on the AWAGroup Files page. I know when I put my Hull Hartley on 160, it sounded like a Collins and with increased output to boot, so the notes down there should sound very un-'29 like....sorry Lou.

Topic: 11879 Message: 11882

Also don't forget that W1AW operates below 010...is it around 003 or so.

Not sure what their hours will be during the BK times. I would vote for a top limit of 012.

Good idea to include the whole 40m 'old' novice band. There was a lot of activity in that section last year. Had my '29 Hartley on 40m a few days ago...can hardly wait...73, Bill K4JYS

I like the idea of a "watering hole" frequency plus/minus qrm. There have been times when the "range" was fouled up and a clear spot available just outside of the range. (ie BARTG rtty contest)

Thanks for reminding me of the new 160M addition. Now i gotta get busy
with an additional tx, finding another desk top, and clip leads to haywire.

Topic: 11879 Message: 11885

Thanks guys for all your input and comments on the 160 meter watering hole. Lets just go with 1800-1810 to start with. I know it goes without saying, but I'll say it, we can operate above 1810 if we choose. I'm not checking logs for 'out of window' operation. hi hi I always listen above and below the AWA window on 80 and 40 anyway, working whatever 1929 station I hear. I haven't been on 160m for 10-15 years so I'll be fun putting our 1929 stations on the air down close to where ham radio really started for us, 200 meters.

I've got the bug to build a new transmitter this year, one with enough coil space to handle a 160m copper tube coil, and just enough 1929 'charm' to sound nostalgic but not get me a zillion OO cards. I've got a couple 211 tubes that are itching to be put on the air.

By the way, yesterday morning I was on the air with my 1929 push-pull Colpitts on 80m cw. There is a group of guys that get on 3562 cw every Saturday morning for some glow worm activity. I was hearing WA8DOF in Michigan and WB9WHG in Madison Wisconsin, besides the MN guys.

I don't have the AWA calendar in front of me but the BK 1929 is the first two weekends in December, so Dec 1/2 and 8/9. I'll take a look on the AWA website for dates. I'm surprised that QSO Party dates aren't up there as soon as they are known. Usually my write up is put up on the Website, along with log sheets. I don't know if the Journal is going to publish the write up like in the past so we may be to go to the web to get all the info.

I'm looking forward to working you guys again this year!

Hey Steve and all, Yes the 'watering hole' frequency is a good starting point. I've always listened above and below the watering hole frequency for 29 stations because there is no hard and fast rule that 29 contacts have to be made in the specified range. I work 'em where ever I hear them, unless they are below 1800 KCS hi hi. I hope to work you on 160m. From the sound of it, 160 meters will be bedlam the first weekend with the DX contest, so we'll have more luck the 2nd weekend.

I have acquired a Deforrest's Training oscilloscope which I want to get working again. It uses a GE number GL-2AP1-A. The filament in mine tests O.K.
There is a 5Y3, a 6SN7 and a 6SJ7 on the chassis. The wiring underneath has not been disturbed.

Apparently, people taking this course assembled these units. I would appreciate any information that anyone has on this piece of test equipment- glad to pay for it.

Big Lee lent (or rented) his name to this school in the '40s. It's a forerunner of De Vry Technical Institute, today's De Vry University.

One could suspect the usual leaky, low-grade capacitors, particularly the one on the high-voltage supply.

I have a De Forest's Training multipurpose instruction kit: sockets, resistors, capacitors, volume control, tuning cap, etc., each item mounted on a phenolic base with Fahnestock clips. It'll build all kinds of electronic widgets.

I'd guess there was a signal generator, multimeter, maybe a signal tracer in the De Forest line. Collect the set!

Topic: 11904 Message: 11904

Hello,

My brother has a Philco 41-221 table radio.

Tubes used are 35Z5, 35A5, 7C6, 7B7, 7B7 and a XXD.

Why did Philco use the tube type of XXD and not a standard type number.

Apparently the tube is the same as a 1AF7.

Thanks
Tom

I don't know why the XX-series designations were used for some early Loctal tubes, other than reverse NIH syndrome.

>Apparently the tube is the same as a 1AF7.

Looks like your typing is on a par with mine - I think you meant 14AF7. :-)

Hello everyone,

I attended part of the Rochester AWA Convention. My father in law was in the hospital in Wellsboro PA. My wife and I were there to see him. I was able to drive to Rochester and attend 2 days.

I enjoyed myself very much like usual. The presentation on the radio equipment in the Titanic was very interesting. I attended the dinner and the presentation on Art Collins. All of the presentations I attended were good. I picked up a Hallicrafters DX-133 in the flea market. I always enjoy looking at all the books for sale. I bought a copy of the book "Codebreaker' Victory, How the Allied Cryptographers won World War II". It fits in with the AWA conference in Charlotte earlier this year. I also purchased a copy of "Empire of The Air, The Men who Made Radio" by Tom Lewis, (not me).

I missed going to the Museum and the Auction.

Folks,

I'm getting closer to completion of restoration on two rare Delco radios of 1933/34 vintage. The models RA-3 (tombstone) & the little floor model version - the RB-3. Both powered by the unique (for home broadcast receivers) Delco 'Electrifier' (dynamotor).

I really need two display only Delco branded - S-12 bulb (not the ST bulb) - Type 38's.

They don't have to have the gold paper lable but do need to have the Delco branded logo on the base.

Thanks,
Robert

From: Ludwell Sibley
Topic: 11927 Message: 11927

As some of you know, CHRS is in the mode of emergency fundraising to purchase the historic KRE transmitter building in Berkeley where they have their museum, audio studio, etc. The cause is the bankruptcy of the building's present owner, Inner City Broadcasting.

I'm not a CHRS member, but have seen these guys working valiantly over the last eight years to take a graffitized, trashed-out building and make something proud out of it. They've done awfully well. The museum looks like a real winner.

They've also built up a great library, starting with the Jim Maxwell (W6CF) collection and recently adding the archives of the Society of Wireless Pioneers.

In any event, the bankruptcy proceeding has been stayed for a while, so the fundraising has a bit more time and is "nearly there." A two far-distant antique-radio clubs (Alabama and Delaware Valley) have kicked in money. A couple of AWA and TCA members in the Bay Area have been particularly generous.

I encourage everybody to tune in to

http://www.californiahistoricalradio.com/2012/06/chrs-is-in-imminent-danger-of-being-forced-to-leave-kre/

and make a pledge. Did so myself, last night.

Ron -

Blame it on reading email before the first cup of coffee kicks in.

The Fischer certainly looks like an early thermocouple ammeter, based on the scale.

The second one certainly looks like a galvo, although I've never seen a galvo without some type of meter scale. I can't think of anything else it could be - it is obviously a null-indicating meter with adjustable sensitivity, the B terminals for the reference (Battery?) and X for the DUT.

Both are beauties and fine additions to your collection. I'll forward the pics to a couple of folks I know who have dealt in some really old meters and see if they can contribute anything.

That sent me digging through some old reference works. I believe that you are correct, as all of the hot-wire scales that I can find are pretty linear above the bottom third or so, and the Fischer scale is as well. None of the hot-wire examples that I can find have a scale anywhere near the ~270 degrees of the Fischer.

Umm, before breaking out the champagne, it would be helpful to read G. F. J. Tyne's monograph "The RJ4 Detector and the Wallace Mystery," AWA Monograph "New Series" No. 1, from 1978. In it he raises the possibility (probability) that Armstrong was anticipated by the Wallace Valve Detector, which was first marketed in 1911. Paul Wallace seems to have come upon a regenerative circuit without realizing it, and sold it for commercial operation aboard ships. (Looking at the diagram, it sure looks like a feedback device.) After the publicity came out about Armstrong's regenerative patent, Wallace attempted to go to court to get his foot in the door, but was crudely rejected.

I know that in the Internet age, anything one asserts on the wire automatically becomes fact, but sometimes an arms'-length approach is appropriate.

w3rlw@... writes:

am writing this as a fellow member of the AWA not in any official capacity.
The opinions expressed are strictly my own.

Every week I am impressed by the volunteers at The AWA Museum. They all
work their butts off getting this New First Line Museum together. I realize a
lot of you have not been able to make the trip to Rochester to see the
progress on the endeavor. The amount of work that has been put into this is
really impressive. But they can not do it alone. The adverse economic
conditions have hit everyone hard and The AWA has not been immune. The success of
the New Museum is not just dependent on hard work by volunteers. Donations
are needed as well. The AWA is a unique organization and the Museum
promises to be a unique entity in that a major portion of it's knowledge base has
been provided by members of The AWA itself. In many ways, we not only
conserve and display history, we have participated in history.

My wife and I have donated to the Museum because we believe in it and I am
asking you all to consider making a gift yourself. I want to make sure
that not only the artifacts but also our own knowledge base, such as the AWA
Review, are available to future generations.

In the past, we always had to pay for the Review. Most of us did without
reservation, Now,it is free. Because someone has made a donation. Why not
consider sending that $20.00 to The AWA Museum Development fund.

11947. BC-342-M miniature tubes

From: Captains_Z
Topic: 11947 Message: 11947

I have BC-243-M receiver and it doesn't have the usual compliment of 6K7's, 6R7, 6L7, etc but uses 6BE6, 6BA6, 6SG7, etc. They look to be factory original and not a modification by someone.

I've checked the usual places for a schematic without luck. It isn't just a case of using the new tube pinouts in the old schematic. Resistor values have changed, the wiring has changed also. To make matters worse, someone has modified the set.

Can anyone point me in a direction for information on this "strange" set?

Thank you.

11956. Audio almost destroyed a cabinet restoration

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2012-10-12 23:52:16 UTC
From: Robert
Topic: 11956 Message: 11956

So here I am in the shop on a delightful Fall afternoon (today).

I've been trying to rescue a little radio cabinet of 1938 vintage... Made of solid oak (pretty unusual) but has areas stained in red mahogany (also odd to me). I could not salvage the finish so wound up taking it all the way down to the raw wood... Filled the wide open grain (The factory finish had completely filled grain as were most all finishes back then.) Sanded it down and by mid afternoon I was applying the light oak aniline dye to the majority of the cabinet with no problem....
>>>>>>>>>>>>>>>>
After a while a shop can get too quiet, so I went to Archive.org to look for some music to listen to...
I grew up in the Rock & Roll era but it was never my music. I really like pop music from the 20's to 40's... A week or so ago I started listening to the funny Music Depreciation (Mutual) programs on Archive. These were recorded in 1944 & 45 at the KHJ Don Lee Studios in L.A.

http://archive.org/details/MusicDepreciation The audio on the first two shows is pretty miserable but then I found that later shows sound pretty good IF you apply your graphic equalizer to balance the sound. Too bad they have not been dubbed like the nearly pristine California Melodies programs from 1940-42 ☐ HI-Fi to my old ears...

These programs and California Melodies (http://www.myoldradio.com/old-radio-sho ... a-melodies) are unlike any other pop music programs from that era...

Program #13 of Music Depreciation on their player list comes up (450204 ☐ Mexican Hat Dance) and starts playing...
>>>>>>>>>>
Back to my project...The problem comes in with making sure there is a clean line between the light oak and red mahogany areas... I'm in there, holding the cabinet in an awkward position, with a fine sable brush & Optivisor laying down a critical line of red mahogany dye when five minutes and 39 seconds into the program I hear something that completely cracks me up!

And instantaneous realization and horror that I am about to royally screw up if the dye bleeds into the light oak. I'm trying to stifle an outburst of convulsive laughter and get the cabinet out of my grip and onto the table.... In the process I knock over a little cup with the mahogany dye!.... More horror! and more uncontrollable laughter! Fortunately the spill does not make it to the cabinet.... Whew!

So all is well..... Give a listen to that first 6 minutes and see if you can understand what you heard at 05:39 that cracked me up.

Robert

11958. Armstrong Days at InfoAge

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2012-10-13 18:28:55 UTC
From: Al
Topic: 11958 Message: 11958

Regen Radio Fans,

2012 marks the 100th anniversary of the development of the regenerative radio circuit by Edwin Howard Armstrong an electrical engineering student at Colombia University. This invention not only greatly improved the performance of radio receivers, but would also become the basis for modern radio transmitters, making voice transmission, and radio as we know it, a reality.

The New Jersey Antique Radio Club's Radio Technology Museum will host an observance of the occasion at the InfoAge Science History Learning Center and Museum in Wall Township, NJ on November 10th and 11th from 1 to 5 PM. There will be a display and demonstration of a wide range of vintage regenerative radio receivers with a formal presentation at 2 PM. The other InfoAge museums will be open as well. Admission is free. A five-dollar donation to InfoAge is suggested.

Working receivers on display will include a mock-up of Armstrong's original circuit receiving a simulated spark radio-telegraph transmission, a WWI era naval receiver, early regenerative broadcast receivers, more sophisticated "regens" that dominated amateur radio and the early phases of the short-wave-broadcast craze in the 1920's and 30's, and a naval RAL receiver that served throughout WWII.

Armstrong is arguably the greatest radio inventor since Marconi. His regenerative receiver was followed in 1918 by the superheterodyne, the basis for nearly all modern radio receivers. During the 1930's Armstrong developed high-fidelity FM broadcasting. His FM technologies also found their way into two-way mobile radio, and radar during WWII.

See: http://www.rtm.ar88.net/Armstrong_Days_at_InfoAge.html for pictures and up-to-date information.

Best regards,
Al

Folks,

A friend has a 2 tube Atwater Kent amplifier island with open transformers. He very much wants to get it operational...

I'd be content to leave it original, but I told him I would ask the groups about how this could be done....

I told him that Hammond has (or had) a 3:1 winding bobbin that I had heard folks say could be used in repairing the 3 tube island, but my friend says that the 2 tube island is smaller and he does not think it will fit...

So... Can you offer any repair options for the smaller island?

Robert

HI all,

Any suggestions for safely removing a a tube base,
with the original bond intact, from a tube so that the wires to the pins
can be cleaned up and re-soldered? I've got a few oldies (UX-201A,
UX-171A) that show no filament continuity but the filaments appear fine
visually. I've tried re-soldering the pins from the end, to no avail. I
had another UX-201A tube with similar symptoms on which the base was
loose, so I took it off and the wires were corroded to the point where
they needed to be cleaned up with emory cloth before they would take
solder. Once I did this, I had a good tube. I suspect if I can get the
bases off of these others and give them the same treatment, I might have
a few more good tubes.

Larry,

I have worked on the same project. Heat one pin of the tube with a soldering gun. When you have observed the solder melt, hold onto the glass and quickly sling the tube downward. Usually most all the solder will sling out onto the work shop floor. Don't do this on a carpet. The solder will never come out of carpet (as per the xyl). If it is a concrete floor, the solder will solidify and can be swept up. Take the smallest jewlers screwdriver you have and prod the end of the pin. usually the wire is visible in the hole. Work the wire with the screwdriver until it is free of residual solder and it wiggles freely. Repeat this with the other three pins. When all four wires are free inside the pins, use both hands and wrench the glass and base in opposite directions to and fro. I am usually successful in freeing the base from the glass. Usually the glue will fall apart out of the seam.

If an ohmmeter check says the filament is bad, you can confirm this with a automobile spark coil. Look for a tiny light within the glass envelope. The current of the coil is so low that it is unlikely to cause damage to the filament line. The spark coil may even seal in a poor filament connection within the pin and the dismantling will be unnecessary.

You can conclusively determine whether the filament is open or just poorly soldered by putting an oil-burner transformer across the filament pins. If no arc is visible, it□s a solder problem. The transformer current-limits to a safe value. A squeeze-type piezoelectric barbecue starter will also work, in a dark room, but not as well.

There□s no real need to take the base off. You just take a ¾□ piece of 22-ga uninsulated wire, make a tightly closed hairpin, melt the □solder□ (pure tin, actually) on the tube pin, and push the hairpin inside. This provides some real estate for fresh solder to cling to.

I□ve fixed a mess of 01As this way.

The bases can be removed by de-soldering what remains on the pins. It is a high tin solder, melting point is high. The pin can be overheated and cause the Bakelite to blister, so flowing modern solder at lower meting point will help in the removal of the tin. Then dip the base of the tube in Propanol alcohol to soften the mud. Gently twist the tube a small amount to remove it from the base.

Caveat! I really do NOT recommend removing the tube from the base. Instead use a flat file to file off a small mount from the bottom of the pin to reveal the exposed lead. Using an Exacto knife with the pointy blade, circumscribe the interior of the pin to clean up the file flash, then, manipulating the blade such that side scraping of the lead wire can be accomplished. Use an aggressive activated rosin flux and fine gauge rosin core solder wire, re-solder, touching the lead wire first to tin it, then to the inside edge of the pin, flow enough to slightly dome the end of the pin.

FWIW, test the tube, if it is still low or somewhat gassy AND it is a type with a thoriated filament, consider rejuvenating the tube filament. Slighly gassy readings usually disappear with re-rejuvenation.

YMMV,

Chas

Re: {Collins} What glue for meter glass?

Hi Gang,

I'm using the recommended "Pacer Formula 560 Canopy Glue" and I like it.

I put 5 drops of glue to the inside of the cleaned-up meter case and carefully replaced the clean glass. It set up in three hours, but needs 24 hours to cure. The metal ring followed, once I was sure the glue held.

I put it back together the next day and replace the meter in the 75S3.

I used one broom fiber from Sherry's broom. It worked perfect for applying the drop of glue.
(She'll never miss it. I hope it doesn't alter the broom's flying ability this Halloween. :-)

The bottle says spilled glue cleans up with water while still wet (1-hour time?? I didn't have to.)

The bottle supplied should glue 5,000 meters! :-) I'll find other uses, I'm sure.

I bought mine through Amazon.....

http://www.amazon.com/s/ref=nb_sb_noss_1?url=search-alias%3Dtoys-and-games&field-keywords=Pacer+Formula+560+Canopy+Glue

Pacer Formula 560 Canopy Glue
Buy new:$3.99
On sale now for $2.84

The glue which gave me so much trouble was silicone glue, but mostly it was my fault. I applied too much.

11980. Armstrong Days at InfoAge Postponed

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2012-11-05 20:03:04 UTC
From: Al
Topic: 11980 Message: 11980

The Armstrong Days observance has been rescheduled to 26 - 27 January 2013 due to the Hurricane Sandy aftermath.

This will align this hopefully annual event with Armstrong's demonstration of his regenerative receiver to Chief Inspector David Sarnoff, at the American Marconi High-Power Station at Belmar, NJ, on 30 - 31 January 1914. This site is now the home of the InfoAge Science History Learning Center and the New Jersey Antique radio Club's Radio Technology Museum.

See: http://www.rtm.ar88.net/Armstrong_Days_at_InfoAge.html

2012 marks the 100th anniversary of the development of the regenerative radio circuit by Edwin Howard Armstrong an electrical engineering student at Colombia University. This invention not only greatly improved the performance of radio receivers, but would also become the basis for modern radio transmitters, making voice transmission, and radio as we know it, a reality.

The New Jersey Antique Radio Club's Radio Technology Museum will host an observance of the occasion at the InfoAge Science History Learning Center and Museum in Wall Township, NJ on January 26th and 27th, 2013 from 1 to 5 PM. There will be a display and demonstration of a wide range of vintage regenerative radio receivers with a formal presentation at 2 PM. The other InfoAge museums will be open as well. Admission is free. A five-dollar donation to InfoAge is suggested.

Working receivers on display will include a mock-up of Armstrong's original circuit receiving a simulated spark radio-telegraph transmission, a WWI era naval receiver, early regenerative broadcast receivers, more sophisticated "regens" that dominated amateur radio and the early phases of the short-wave-broadcast craze in the 1920's and 30's, and a naval RAL receiver that served throughout WWII.

Armstrong is arguably the greatest radio inventor since Marconi. His regenerative receiver was followed in 1918 by the superheterodyne, the basis for nearly all modern radio receivers. During the 1930's Armstrong developed high-fidelity FM broadcasting. His FM technologies also found their way into two-way mobile radio, and radar during WWII.

See you there,
Al

Hi all,

OK, so this is a one in a million, but I have acquired a Murdock fixed spark gap that is missing the two 3/16(?)horizontal rods with the Zinc barrel ends. and matching knobs.

I looked up the gap in an old Murdock catalog, and the barrels are slightly tapered (like a bullet) as they face each other.

I can get rod stock and similar knobs, but the zinc barrel ends are a dilemma.

Does anyone still fabricate these kind of parts?

Also, I am interested in buying interesting fixed or rotary gaps to feed my addiction.

Thanks,

Craig

I just completed a QSO on 10 meter SSB with IT9OSF in Sicily. I was rather taken aback when Giovanni told me his rig was homebrew so I checked out his listing on QRZ.COM while talking to him. Needless to say when I saw the photos on his QRZ page I was blown away at the quality of construction of his tube based ham rigs plus his hombrew replica(?) of an Italian facist peoples radio (hello, calling Robert Lozier?). Do yourself a favor and checkout the page for IT9OSF on QRZ.COM and I don't think you'll be disappointed!

Good morning, Marc Ellis and Ludwell Sibley;

Yes, there are some "problem children" out there. And, Bill Burns pretty accurately described the one major and fairly easy way to make our protection for our Yahoo mail accounts a little better. There are some other things that you can do, but they are not very popular. It is true that, for the most part, our anti-virus program on our own computer may not be all that helpful, when you consider that they are going to our Yahoo e-mail or groups account. Some of this really should be handled by the Yahoo people, but that does not seem to be happening.

Please note that this kind of thing is not unique to the AWA group. There are many others that are similarly affected.

The main defense still seems to be to be prudent and cautious about opening or "clicking" on anything that seems to be odd or a bit unusual, such as a UPS or DHL package that they could not deliver to you, and they need additional information on how to find you, so please "open the enclosed document" to help us. Right. One really obvious one that came here just recently was from the "Irs" (their way of mis-spelling the abbreviation) and telling me that my appeal of my tax return had been denied, and "full details are found in the enclosed document." No, I did not "click" on that one either, nor do I have any appeal active with the Infernal Revenue Service. It may be that the guy who sent that one is not aware that this is not the time period for individual tax reports, and the IRS does not really work that way either.

Yes, private entrepreneurship is alive and well on the Internet.

Enjoy;

Ralph, N7KGA
Latte Land, Washington

After reading some of the comments about difficulty in accessing the AWA amateur contest rules page I checked again to make sure they are still readable. I am able to access the 1929 Rules and Logsheet just fine. If anyone is having trouble, email me and I will be happy to email the rules or logsheet.

As I've done in the past, I did send a snail mail of the rules and logsheet, albeit rather late this year, via USPS. They should be arriving Wednesday. I sent them to the people who I felt may not have access to this AWAGROUP list or AWA list or web access. There are alot of OT's in the 29 QSO Party who are not on the web. Most of the folks on this list won't be receiving it because I know you have access to the Awa website and rules. Never-the-less I sent out around 70 logs. The snail mailing is not sanctioned by the AWA, nor reimbursed by AWA. The money for paper, ink, postage, envelopes and the effort are a donation to the 1929 Group by me because I love the the event so much.

GL in the 1929 QSO party this coming weekend and I hope to work you! 73 Scott WA9WFA

To all,

The first link (Events Schedule) works on my Windows Explorer 9, and will bring up link 2 and link 3, but the links from the Events Schedule will not work on the Google Chrome browser. And there are problems with links 2 and 3 as stated (below).

Here is the 2012-2013 event schedule:
http://antiquewireless.org/pdf/AWA_2012-2013_Event_Schedule.pdf
---
Kelley Link "Contest Rules, Log Sheet" produces this...

Link 2.....
Here are the Kelley Rules (but no log sheet):
http://antiquewireless.org/pdf/kelley_rules.pdf

Cundall link "Contest Rules, Log Sheet" produces this...

Link 3.....
Here is the Cundall Log Sheet (but no rules):
http://antiquewireless.org/pdf/cundall_log.pdf

Since the AWA is a Ham Radio organization, there should be more visible links (easier to find) for ham activities that "actually work" and deliver the expected information.

The AWA web pages need a major overhauling. AWA should have one web site with one "master" home page. Links should work with all popular browsers.

Not much going on here so maybe you would find it interesting/amusing to see a project I'm working on....

At he bottom of the page you can see a partial model I've done using SolidWorks 3D software...

http://antiqueradios.com/forums/viewtopic.php?f=1&t=209695&p=1760147#p1760147

I'm waiting now for brazed diamond core drills to come in the mail. The old way to drill holes in glass in the 20's was to use copper tubing and ground carborundum (valve grinding paste). But the new drills are supposed to be less risky.... Id sure hate to be finishing up number 21 of the 21 holes on the front panel only to have it go CRACK!

I'm beginning to understand why there are so few vintage glass sets out there.... Still, I want to at least give it a try....

Robert

Subject: [AWA] 1925 Quadraformer TRF modeled in SolidWorks

Not much going on here so maybe you would find it interesting/amusing to see a project I'm working on....

At he bottom of the page you can see a partial model I've done using SolidWorks 3D software...

http://antiqueradios.com/forums/viewtopic.php?f=1
<http://antiqueradios.com/forums/viewtopic.php?f=1&t=209695&p=1760147#p1760147> &t=209695&p=1760147#p1760147

I'm waiting now for brazed diamond core drills to come in the mail. The old way to drill holes in glass in the 20's was to use copper tubing and ground carborundum (valve grinding paste). But the new drills are supposed to be less risky.... Id sure hate to be finishing up number 21 of the 21 holes on the front panel only to have it go CRACK!

I'm beginning to understand why there are so few vintage glass sets out there.... Still, I want to at least give it a try....

Robert

It might be a good idea to anneal the glass before drilling it.

Robert
Back in my younger days, I worked in the auto glass business and did some regular glass and mirror work also. We used a two sided tapered glass bit in a hand drill. We made a round dam out of glazing putty, 3" - 4" inches or so around where the hole was to be made. . In the small pool was put turpentine and carborumdum and drilled away, not much pressure so that it wouldn't break out on the back side or chip the mirror backing. Always worked and that was how the shop did it all the time. The liquid kept it cool and the grit ground away on the glass... 3 to 4 minutes and the hole was through a 1/4" plate glass.

Haw! I went out and checked the Tube Ghetto with no results. Vacuum Tubes Inc. (www.vacuumtubesinc.com <http://www.vacuumtubesinc.com/>) lists them as "call."

For the record, the 6T9 is half a 12AX7 plus a 6AQ5. A useful part but obviously rare.

From: w6adv
Topic: 12027 Message: 12027

Hello,

I am looking for a knurled knob for a 1916 Bunnell Vertical Spark gap I am restoring. These were also used for adjusting crystal detector as well as other uses. It would be threaded, although anything similar looking with a set screw would be acceptable. Here is a link to a picture. http://www.radiomuseum.org/r/bunnell_standard_spark_gap.html

As best I can tell this would be in the range of 5/8- 1 inch in diameter.

Anything close would be appreciated.

Thanks,

Craig

12029. 1929 BK Affair: Final Scores for WA9WFA

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2012-12-10 17:57:33 UTC
From: whitebear1122@comcast.net
Topic: 12029 Message: 12029

Alas WA9WFA was MIA for the second weekend so I could only watch the BK emails talking about the 160m activity. Friday we drove down to Madison WI to visit my daughter at college with the original plans to drive back Saturday afternoon and work the BK but earlier in the week my Mom reminded me it was my Dad's 80th Birthday sooooooooo, instead of driving home Saturday, we drove to my folks house for the rest of the weekend and celebrated my Dad's birthday. Family comes first. Drove home Sunday afternoon into a blizzard, and was welcomed home with 16" of snow on the driveway.

I am so envious of all the activity on the 2nd weekend. Sounds like conditions were fabulous. I was all set to go on 160m too. Had the coil wound and tuned on frequency. M y push-pull 210 Colpitts was incredibly rock stable on 160m, even when thumping the chassis. Wish it was that stable on 40m..... Sometimes when ending a 1929 QSO, I'll send SK and thump the chassis on the K, giving out a really strange " sproing" twang. I know, stupid but fun.

My total count from the first weekend was 32 stations between 40m and 80m. I was running a pair of 210's in a push-pull Colpitts configuration. I had a ball that first weekend and worked some good DX including BC, ONT, Maine, New Mexico, Montana, NY, NC .

I know of several new guys operating the event so that was exciting to see more activity. The first two weekends in December are very popular with the participants so I hope the 29 QSO Party stays put on those first two weekends and not change dates. Why mess with a good thing..

The logs have started pouring in. Steve VE7SL's sent his in at something like 4:15 in the morning. Don't you guys sleep in BC?

Please send in your logs, even if you made 1 contact. It's so much fun to see who all was participating and who they worked. A couple years back a fellow built a transmitter and made 1 contact in the 29 QSO Party and sent in his log with great pride. I admired him for that.

In order to figure out who all participated , I go through all the logs and come up with a list of all callsigns documented . This gives us a good look at how many stations were operating in the event regardless if they sent in a log or not. I think we usually have 66% logs sent in. The last of the logs seems to trickle in around the 3rd week in January. If you email the log in, I will reply with a confirmation email to let you know that I got it.

Thanks to all the folks who participated and made this event so much fun!!

Next stop is the January Linc Cundall OT Contest . I am hoping to put the 1935 Gross CP-100 and National NC-101 on the air. I just acquired a NOS Millen 90711 VFO that I'll interface with the Gross. Right now I only have 80m capability with the Gross.

Scott

You can use your new '29 160 meter rig in the upcoming Linc Cundall contest. It will give a powerful multiplier. It would be interesting to know the final tally of 160 meter BK qso party activity. I'm still gathering parts for my 160m '29 tx. Going to 160 would break the monotony when all currently audible calls have been worked especially during the second week.

As for the sproing twang, most of us know when keying relays are mounted on the breadboard hi.

Thanks for your bookkeeping.

Steve,

Somehow I missed you on 40M this year. Usually we QSO on both 40M & 80M.
Didn't hear you at all on 40M either weekend.

Hi,

I'm working on a Zenith 6S57 console for a friend. I'm trying to disassemble the dial and tuning assembly for cleaning. I got the white Z pointer off but am having problems removing the red "Split Second" pointer. I don't want to damage it. Does it just pull off, is it threaded or am I missing something?

Thanks, 73,

Mark, N3NBL

Hi Mark--

I know how frustrating your situation must be. But--even though I have disassembled a dial with a split second pointer, it was so many years ago that I just don't remember.

I suppose you could try gently turning it counterclockwise as if you were unscrewing it--then you could probably tell if it was slipping or unscrewing.

If I had to guess I would say that it is press fitted, not screwed on.

Mark,

If I'm not mistaken it slips off.

Should have two slits down the side and it is press fit, so you should be able to twist and pull it off. Look for the slits to be sure.

This is from memory and you know how that goes.

Thanks for the replys everybody.

It's definitely the split, press fit type with the slits. It's really stuck on the shaft though. Got behind the plastic dial and tried to pry on it and even tried to widen the slit with a screw driver to crack it loose. Don't want to slip and damage the plastic dial. I have the feeling this has been on the shaft since 1936.

Any thoughts? Solvent and a long Q tip?

Thanks,

Mark

Try a few drops of Kroil Oil, it works wonders for me on stuck nuts and bolts. It may take putting it on the shaft area for a couple of days. I use it on a lot of Coleman lanterns that I repair and restore that haven't been used since the 20's and 30's also on my automotive needs. Also if you can get to it with the tip of a soldering iron and not hurt the plastic dial, heat works wonders on things that are stuck.

Subject: RE: [AWA] Zenith 6s57 Pointer

Thanks for the replys everybody.

It's definitely the split, press fit type with the slits. It's really stuck on the shaft though. Got behind the plastic dial and tried to pry on it and even tried to widen the slit with a screw driver to crack it loose. Don't want to slip and damage the plastic dial. I have the feeling this has been on the shaft since 1936.

Any thoughts? Solvent and a long Q tip?

Thanks,

Mark

Mark,

If I'm not mistaken it slips off.

Should have two slits down the side and it is press fit, so you should be able to twist and pull it off. Look for the slits to be sure.

This is from memory and you know how that goes.

Regards,

Joe Koester/W4NSA

Subject: [AWA] Zenith 6s57 Pointer

Hi,

I'm working on a Zenith 6S57 console for a friend. I'm trying to disassemble the dial and tuning assembly for cleaning. I got the white Z pointer off but am having problems removing the red "Split Second" pointer. I don't want to damage it. Does it just pull off, is it threaded or am I missing something?

I googled Channel Master 6437A and got this.

AM/FM/LW/SW Radio Japan .(Portable/Tabletop), Signal (AM/FM), Brand (Channel Master), Model (6437A), Features (AC Powered), Operates with 6 c batteries, or built-in ac power cord. This late 60's channel master (pictured) works fine and is in good cosmetic shape. . 12?w x 8 1/2?h x 5?d.

It didn't say anything about GE though.

12044. 1920s QST MOPA article sought

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2012-12-23 19:37:33 UTC
From: Larry Szendrei
Topic: 12044 Message: 12044

Hi everyone,

I remember several years ago Bob Raide W2AM had sent me a copy of an article from a 1920s ARRL handbook of a MOPA using 2 triodes - I think '10s, but the IIRC article had also said other triodes such as '03s or '11s could be used. The master oscillator section was built into a can - I think maybe a growler - to isolate it from the PA.

I seem to have misplaced it, and don't have the edition of the Handbook that has the article. I do have the CD of QSTs from the era, so if this transmitter had first appeared as a QST article, and someone could narrow down the search to year or issue, I would appreciate the reference. Or a scan of the Handbook article would also be welcome.

Thanks,
-Larry/NE1S

September, 1928 issue of QST by Ross Hull. See pp. 9-14. Pair of UX-210s. First stage is a Hartley with High-C tank installed inside an aluminum kettle.

League subscribers can download it here:

http://p1k.arrl.org/pubs_archive/10730

It's probably best to use a low sudsing detergent. Someone put dishwashing detergent in our cleaner at work and the suds overflowed the tank.

Robert, Jim, Leonard,

Thank you for the info on ultrasonic cleaners. I have printed your responses and will keep that info with my cleaner. I have studied Robert & Jim's info and now have allot to digest. Sure helps to have info from a couple of pros! Hopefully, others on the reflector will benefit.

I just gave my cleaner its maiden voyage. Seems to work "as advertised". I'm anxious to eventually try the aluminum foil experiment.

My cleaner is from Harbor Freight # 95563 and sells for ~ $90.00 ($80 on sale) and seems to have all of the features Robert described in his article.

Thanks again. This is the kind of thing I really like about this reflector. Happy New Year all!

From: hughfullman
Topic: 12060 Message: 12060

Hi,

I'm not trying to buy or sell anything, but I am looking for a 1L6 radio tube. I can either try to buy one, or re-design the radio to use a 1R5. I don't want to pay more than $25 for this tube, but I have found it to be very rare, and expensive. Hopefully, someone out there has one he doesn't need, and will send it to me at a reasonable price, or he might want to trade it for one PAIR of 6L6's which I have 3 pair, and I really don't think I will ever build an amplifier for my guitar, and if I did, I would use 6K6 or 6V6 which I also have a few.

Thanks.

Hugh KB1YPA (not on the air yet... need to get a transmitter)

Yeah, Hugh, the 1L6 wasn't used in very many radios - the Transoceanics are the only ones I am aware of. I have a Transoceanic with a serviceable set of tubes - the same tubes that were in the radio when I got it as a high school freshman. I had the good luck of figuring I needed to have a spare 1L6, so I bought one at the corner Lafeyette store back then for somewhere around $6, which was a lot of money for a high school kid with a paper route back then. Actually I was having a problem with the local oscillator quitting, tried a bunch of things to no avail and bought the tube because of those problems. The new tube made no difference. But the problem hasn't recurred since we moved away from that location, so I've sort of concluded my problem way back then was low line voltage, causing the filaments to run a bit on the cool side. But I'd like to hang on to my spare because I may need it someday. The Transoceanic has been my bedside radio since those days, and still is.

There aren't that many IL6s in circulation, and the prices reflect that. I hope you are able to find one at a price that works for you.

When you get on the air, come join us on 75M or 160M AM. I am assuming from your call sign you are also in New England, but I could be wrong. There are pleny of hams, as well as non-hams, on this list.

Hi guys
 Your discussion brought back memories of my long ago radio/tv shop experiences, at my Elmer's service shop! Some of those old "3 way" (AC/DC/ battery operated) portable radio receivers used selenium rectifiers. (Others used 117Z3, 117Z6, etc vacuum tube rectifiers).
 As these selenium rectifiers aged, the forward voltage drop, across them would increase.
 This resulted in a drop in the B+ voltage. More importantly, it caused a reduction in the filament voltage available, for the receiver tubes, as the filament voltage was derived from the B+, via a dropping resistor.
 The 1R5, etc. frequency converter was the most vulnerable stage, to this reduced filament voltage problem, and the typical symptom was as per your description. The local oscillator would cease to function. IIRC, the problem would often initially happen at the low end of the BC band (and/or any shortwave bands), and then progress toward the high end of the BC band, as the selenium rectifier continued to degrade, and/or the transconductance of the tube continued to fall, as it aged.
 In addition, low line voltage would produce a similar symptom.
 I don't recall what rectifier type was used in the Zenith Transoceanic receivers. I believe that I have read info about using the more commonly available/much less expensive 1R5 (with a mod to the 1R5), as a sub for the 1L6, with some performance compromise, but you probably know about that.
                  GL with your seach for the 1L6.

Hi Ron!

My Transoceanic uses a selenium rectifier, bingo! I'll bet that contributed to the problem, which is now being compensated by the typically higher line voltage than we had back in the days when I was having the problem. And you're right, it happened at the low ends of the bands, because that is where feedback is the lowest.

Ah, the 1L6 pain! Yes, rare and expensive. Used in the late-vintage Transoceanics, a few Zenith broadcast-band sets, the National NC-66, and many of the T-O imitations including the Hallicrafters, Magnavox, and Silvertone versions. Also one of the Signal Corps field radios, R-1004/GRC.

I tried a 1R5 in a T-O once - the way my set was wired, I had to amputate one of the pins on the 1R5 to avoid having to mess with the wiring. That isn't necessarily true in other production. It worked fine in the broadcast band but, due to internal capacitances being different, the dial calibration was progressively worse off as one went higher on the short-wave bands. People also somehow kluge a 1LA6 loktal replacement into the set.

The 1L6 (and 1LA6) normally has the incoming signal applied to the fourth grid, whereas the 1R5 expects the signal on the third grid. Hence the differing capacitances.

The 1U6 is a half-current (25-mA) 1L6. If one of these turns up, you can wire a shunt resistor across the filament to use up the excess current.

I once had a National Electronics new-in-box "1L6." Under close inspection, one could see where the original "1U6" had been buffed off during re-branding. Plug that one into the Trans-Oceanic, turn it on, and POOF. However, other National Electronics 1L6s turned out to be genuine.

Friend of mine once bought a whole stacker of 1L6s at a hamfest for 25 cents each!

Previous advice on this reflector regarding flaky senilium rectifiers is Good Stuff. In my T-O, the set would work fine when cold, but as it warmed up the rectifier output would fall and the set would stop. Replace Obsolenium with silicon!

The other pain in T-Os is the 50A1 ballast tube - similarly rare and expensive. Fortunately a 1000-ohm 3-watt resistor will replace it, with the addition of a 9.1-volt zener across the filament string. Gives better voltage regulation than the original setup.

Good luck,

Ludwell Sibley

Subject: [AWA] rare tube

Hi,

I'm not trying to buy or sell anything, but I am looking for a 1L6 radio tube. I can either try to buy one, or re-design the radio to use a 1R5. I don't want to pay more than $25 for this tube, but I have found it to be very rare, and expensive. Hopefully, someone out there has one he doesn't need, and will send it to me at a reasonable price, or he might want to trade it for one PAIR of 6L6's which I have 3 pair, and I really don't think I will ever build an amplifier for my guitar, and if I did, I would use 6K6 or 6V6 which I also have a few.

Thanks.

Hugh KB1YPA (not on the air yet... need to get a transmitter)

12065. Nothing on AM broadcast radio?

Yahoo group: antiquewirelessassociation (2010 — 2015)

Hi Everyone.

I have heard it said that there is nothing on AM broadcast radio unless you like talk radio, which I don't.

Here in Raleigh at night AM 740, Zoomer Radio, from Canada comes in.

Tonight is "Big Band Sunday Night".

Its great to hear some nice music on my tube radio.

Tom, N4TL

Yep, that's the station that took over 740 in Toronto from the old CBC station CBL many years ago. There's another "clear channel" powerhouse 740 from Houston - or used to be - that would compete some nights.

I used to listen to CBL all the time from the Buffalo area. Beat the pants off of the local AM stations.

I'd listen now but in my cramped quarters the only radios I have powered any more are Kenwood rice boxes for my Ham station and they both have severe AM band filtering so are pretty useless for AM DXing.

12069. APR-4 tuning unit knobs needed

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2013-01-07 17:56:01 UTC
From: Jack
Topic: 12069 Message: 12069

I recently purchased a 'complete' R-54/APR-4 with a complete set of TN-XX tuning unit plug-ins. After unpacking the 3 boxes I found that 2 of the tuning units are missing the big, scalloped black plastic tuning knobs. The listing states that these were sold 'as found' & the knobs are indeed missing from the units shown in the photo, so I don't have any real basis for arguing with the seller who I've done business with in the past. So now I'm looking for one or two of these knobs with which to restore these units. I'm even interested in them if they come with the entire tuning unit.

Jack

Ron

Did you ever notify anyone directly at The AWA about your failure to receive the award ?

I received an email directly from John Dilks urging that this needed to be corrected and while it is true I responded that it was not my area, I also forwarded John's message on to Bruce Roloson. Bruce is quite sick at the moment but he apparently is the correct person to talk to. Now today I pursued this matter with Bob Hobday. Apparently the long time provider of the awards has decided no longer to provide them. I understand that there is an effort underway to provide you with your award as soon as possible. Again, better that you contact Bruce directly to get the information

I would suggest that you either Email Bruce or call him on the phone. I can assure you that there is no effort to "insult" you or detract from the fine work you have done to merit the award. A little further research indicted to me that you most certainly deserved the award.

Please try and understand that all of us have pretty full plates these days. I am sure you of all people can appreciate that.

12073. RE: [AWA] Tyne award plaque?

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2013-01-10 01:41:05 UTC
From: Ludwell Sibley
Topic: 12066 Message: 12073

I can't address Ron's actions, but I called Roloson long ago - Nov. 13 - and got the story that the plaque maker was being unresponsive, and promising action. Sounds like there's no will to "make it happen."

As for "the long time provider of the awards" : that provider, starting in 1971-72 for the Houck Awards and 1980 for the Tyne Award, was none other than the Antique Wireless Assn. Inc. There was no outside sponsor. So here we have the following events:

- The present-day version of AWA recruits a new administrator for the Tyne Tube Award.

- The present-day version of AWA then invites nominations for six prizes, Tyne Tube among them ("Journal," July 2012, p. 13).

- The new Tyne administrator and his backup receive at least one timely nomination.

- The present-day version of AWA announces the winner of the Tyne and four other awards that supposedly rely on members' nominations ("Journal," Oct. 2012, p. 32).

- You report hearing that the "long time provider of the awards has decided to no longer provide them." So the present-day version of AWA has apparently decided, having botched Lawrence's plaque, to cancel the award after announcing it. This is nonsense.

So we now have the 2011 screwup on the Tyne Award followed by the 2012 screwup. What will happen in 2013? I don't know if Ron's insulted, but I certainly am.

Robert,

I have never worked on anything that old yet (but hope to), but even if you could identify it, I doubt you would ever find a replacement. I didn't see the schematic, but from the picture, it looks like a TRF radio and the variable capacitors are identical, and therefore, so are the coils. I would recommend that you wind your own with 26-32 AWG magnet wire on a similar form. If you have a signal generator and a scope, you could wind it with a few more turns than you think it is. Next excite one of the other coils with the generator set somewhere in the broadcast band, and the tuning cap set in the middle. Then find the frequency where it peaks, then do the same with the new coil and remove turns until it peaks in the same place. I think that's the way it works.

Good Luck,

Hugh

Oh, by the way, thanks for all the replies. I got the pointer off. Took the radio to a clock repair place and asked if they had some kind of puller. They said no, they just use brute force-carefully. I found a hemostat in my assortment of odd tools that had bent over ends. Grabbing it firmly with that and pulling it firmly, after a few days of soaking it with PB blaster, it came off. No damage to anything. Now for the rest of the work.

Thanks,

Mark, N3NBL

Mark,

If I'm not mistaken it slips off.

Should have two slits down the side and it is press fit, so you should be able to twist and pull it off. Look for the slits to be sure.

This is from memory and you know how that goes.

I am restoring a 1939, 9 tube AC/DC Zenith Shutter dial radio and have a general question. I am about to order new pushbuttons for the automatic tuning assembly and on/off switches. These are 5/16" square buttons, 1 1/8" long. There weren't any pushbuttons with this set. I understand that the pushbuttons are a type of push/pull. All that is in the set now.. are the rectangular metal switch activator shafts. Somehow the pushbuttons are to be attached to these metal shafts.

Does anyone know if there was another part in between the metal shafts and the pushbuttons? Someone suggested the pushbuttons are glued to the shafts. I would think there may have been an additional interface.

thanks in advance John

Hi Hugh,

FYI - I've been a vintage broadcast radio collector since before 1967. Since the mid 70s I've enjoyed exhibiting my goodies at the various historical conferences. Over the years, proper documentation of my artifacts has become very important to me...

So identification of items is something I prize. These mystery RF coils are complete as they are with the only exception being that the gold ink separated from the clayed paper label and literally fell off... (Probably due to high moisture...)

I'd be willing to guess that there are still more than 100k 20s vintage radios left here in the USA. You can never be sure who will see a post and respond.

Too bad we can't make a law that DEMANDS! EVERY collector view ALL queries at least once a week ;<)

Hi Dale,

Have had a crummy cold the past few days so not as observant as usual. Yep I know the coil kits and knock-down kit sets that were available back in the day.... I was a little surprised to just take another look at the SLF tuning condensers and see that while they are certainly factory made, they are devoid of any branding... That might have pointed me in the direction of who might have made the coils since some of the tuner kits paired RFTs with the condensers.

So... The quest continues...

Robert

Robert -

You sure do have a tough one. I can't recall seeing any TRF tuning sets that were completely unmarked. The labels on the coil endcaps are likely the best indicator but I've never seen any labels like those. You may have to look at a lot of TRF sets in a museum or at a swap meet and see if you can find a set with those labels which are readable. I'll just have to wish you luck because it has both of us stumped.

I'm going to send the photo link to a friend who is not on the list and see if he recognizes those labels. He has seen a lot of oddball TRF sets and many homebrews in his years.

Hi Joe

Thanks... I would appreciate any input you can provide. The radio portion has been restored and plays fantastic. I am about to order a set a new pushbuttons and shields. The new pushbuttons are reproductions, solid plastic with no core opening. I am wondering the best way to attach the buttons to the steel shafts. Also, I think a spacer may be needed to fill a space gap of approrimately a 1/4"
Thanks again for the assistance. John

Hi John,

Zenith is my favorite manufacturer, and I really like the 1935 to 1938, and 1940 to 41 models. You will notice the 1939 model year is not included in MY LIST of favorites. The radios were well built, sounded good, and had some great cabinets. But in my humble opinion the Tone Organ was a disaster for the restorer of many years later. How I wish they had stayed with a simple rotary switch for the tone. I have a 9-tube table model and a 15-tube console in my collection from 1939, the rest are from earlier or later years. Like I said – this is my opinion only, and we don't all like red heads or blondes so that's a good thing.

The push buttons for the stations are flat based and sit in the escutcheon. The two buttons for the on off are glued to the two prongs of the switch, as are all of the buttons for the blasted tone organ.

You have a couple of options, depending upon how many buttons are missing or are broken off. Installation of station pushbuttons is very simple, if the tone organ buttons are missing or broken it is a lot harder.

The tone organ buttons are glued to a fiber shaft with a rivet through the bottom end. The rivet is the contact in a switch for that particular tone. Many times the fiber shafts are broken or will easily break when you disturb them. When working on a 1939 with good tabs I make a protective box out of cardboard to protect them when working on the chassis. If they are broken or are very weak (I suspect moisture weakens them over time) they will have to be replaced, and you are better off to replace all of them at once.

Turn the tone organ over and look at the back and you will see a couple of pieces of metal that are bent and hold the back of the switch together. You can use a Dremel and grind the ears off (careful!) and remove the back and then replace all the fiber shafts with the rivet to the rear!

With the new shafts in and the contacts and switches cleaned reassemble and put some good epoxy on the metal and the back part of the main switch to put it back together.

I have saved old broken pushbuttons (also called fingers) to repair a tone organ, but more often than not the color of the buttons is different, so you might want to get a whole set or reproduction buttons and the shafts, if needed.

When you glue the buttons on to the shafts fit the switch back into the escutcheon, and the station selectors and see just where you want to glue the new buttons on. You don't want them to stick out too far or not far enough. Remember that they depress to one level and pull out to another. Do this and measure before gluing. You want them to all sit at the same level when they are all out or all in!

With regard to the on/off buttons I seem to remember that they are slightly longer or shorter. But my memory could fail me.

There are a couple of providers of pushbuttons, and those little fingernails above and below the pushbuttons for the tone organ and station selectors. You want them to match too. I recall ordering a whole set from Larry Bordanaro several years ago for about $75, and Great Northern sells some and also another fellow makes some real nice reproduction items for many, many radios.

When you get this all done it will look and sound great.

Hope this helps, feel free to contact me later if you need any other info.

Hi john,

There are several things to consider when restoring these sets. I will send you some info tomorrow if you'd like. I am away from home at the moment.
Regards,
Joe

Subject: [AWA] 1939 Zenith Shutter Dial

I am restoring a 1939, 9 tube AC/DC Zenith Shutter dial radio and have a general question. I am about to order new pushbuttons for the automatic tuning assembly and on/off switches. These are 5/16" square buttons, 1 1/8" long. There weren't any pushbuttons with this set. I understand that the pushbuttons are a type of push/pull. All that is in the set now.. are the rectangular metal switch activator shafts. Somehow the pushbuttons are to be attached to these metal shafts.

Does anyone know if there was another part in between the metal shafts and the pushbuttons? Someone suggested the pushbuttons are glued to the shafts. I would think there may have been an additional interface.

thanks in advance John

hello Joe

Thanks a million for the info on the 39' Zenith pushbuttons, I really appreciate it. First of all... I noticed the stations switch had come apart. The switch portion stayed with the radio chassis while the front face stayed in the cabinet. After that was re-attached... I dug out my micrometer and set to doing a bit of measuring. The fit is much better now, but I still think a 0.15" spacer block on each station pushbutton will make the fit feel so much better. Should be easy to glue on a hard rubber pad.

You are probably totally correct in thinking the repro buttons will have a different color from the originals, I think it will be better to replace all of them. One switch wafer is broken and needs to be replaced. I had a good long look and I think I'll take your advice and order a new set there too.

This is a beautiful set and plays terrific. The owner can't remember ever seeing the original station pushbuttons.

Again... thanks greatly for the feedback John oneradiodoc.

> The push buttons for the stations are flat based and sit in the escutcheon. The two buttons for the on off are glued to the two prongs of the switch, as are all of the buttons for the blasted tone organ.

12100. Potting Compound

Yahoo group: antiquewirelessassociation (2010 — 2015)

From: steve_n8ye
Topic: 12100 Message: 12100

I have several old spark coils, also know as buzz coils by the antique car folks. Usually the internal capacitor is bad and I replace the caps. I find the best value by experiment. I replace with a value that gives the longest spark, and the value can vary from 0.2 mf to 2 mf. The Ford coils have tar/asphalt potting. Recently I worked on a Schug(mfg co) coil which is twice the size of the typical Ford coil. The potting was nasty tough. Rather than black tar, it was a maroon / dirty pink color. It was so tough, it might as well have been epoxy. It will melt with a heat gun, but it smokes before it melts. What is this stuff?
Thanks
Steve N8YE

It's probably gutta percha. As an insulator, it was about as good as could be had before the synthetic resins/polymers were invented.
As you noted, it will become pliable with heat but probably the best
way to deal with it is to carefully cut it away in small pieces with a razor saw and/or Dremel tool. It isn't toxic but you should try to avoid breathing its dust or its burning fumes- since it's a natural substance (similar to latex) you could develop an allergic reaction to it under continued exposure. I don't think that there are any common solvents that will vigorously attack it, but soaking it in a petroleum distillate like naptha will probably slowly embrittle it, possibly to the point where it can be flaked apart in chunks. However, this may take a very long time.

Thanks,

That explains why it starts to smoke right at the melting point. I had to slowly chip away to access the old capacitor in the buzz coil. The old cap is rather large for its capacity at 2.75 X 4.75 X 0.5 making a leaky 0.5 mf. Its made of what seems like tin foil and wax paper folded acordian style rather than wound.

Sounds like the manufacturer of your coil "marched to the beat of a different drummer". It would be interesting to know if the (relatively) expensive gutta percha potting and the oddball cap construction materially contributed to the performance/longevity of the coil. Since the cap eventually failed, I would guess that it did not.

Some early radios were similar to this- it's as if the designers wanted them to be able to still function 500 years from now. Then the notion of "disposable consumer goods" took hold.

Everyone is probably aware that my collection passion is Military Radio.

Of all the receivers I have in my collection, none are more interesting than the command set receivers. In my operating room I have a 3 bay receiver rack with 75, 40 and Broadcast band. The Broadcast band is especially interesting. Like Ron says in his web page, just a few feet of wire. Incredible audio and great sensitivity. If you get your hands on one of these, fix it and keep it. They are great radios with a great history.

You will be able to see them in action in my Display for the New Museum. The Radio Room of a B-17 bomber. With all of these great pieces properly displayed. It will be one of the few accurate, totally functional installations in existence.

I was at the Job Site today and the progress is truly remarkable. It is a unreal feeling to see all of this take shape. From designs and drawings to real rooms and partitions. Man it is really going to be something. I just stood in there today, I could hardly speak. We did it ! We really did .

The Grand Opening is August 20, 2013. At The AWA Convention. A gala reception with entertainment and refreshments will make this a truly unforgettable beginning to what should be an unforgettable Convention.

I would be delighted to see you this year.

Roy Wildermuth
AWA Annual Convention

Roy, I am with you on the ARC5 series, transmitters and receivers. Gone are the days when they were new in the box at $5 to $10 at Radio Row in NYC. My 2nd Novice xmtr (after a 1 tube 6L6) was the 80 M Army version, with stable clean CW. Made it to Calif with a LW on the last day of my Novice (went the Tech route, then General and Extra). Had a crystal conversion which I removed for general operation. My ARC 5 receiver was the Q5'er, the LF one (I also had the matching BC/LF ship shore/air to ship xmtr) which I used as a tunable if for my AR3. They were all amazing in performance given no xtl filter, with an 85Kc IF and an RF stage. It is great that you are helping to keep historical sets and a famous bomber's radio position available for viewing. I grew up at Ft. Monmouth, home of the Signal Corps, in K2USA MARS station (my Dad was the founder/builder, W5EWF) and hung out in the SC Museum (now at Ft. Gordon). So MIL radio is also an interest of mine.
Also early wireless, landline telegraph (have small collection and actually was guest operator on a PTT net in Turkey, as they use international code like hams do). Have a nice pair of 1919 to 1924 era regens plus several I made using National Velvet Vernier dials. I have some Army radio manuals for the VRC12 FM set and a few others - do you have any interest? Please respond on my new email wa2kbz@..., as I am moving there from Yahoo.
73 Karl

2.5 Ohms. The gold dot is a 0.1 multiplier. A silver dot would be a 0.01 multiplier. These are the old "dog bone" resistors.

February 23, 2013 from 7 AM to 2 PM (no sales before 8 AM)
Jim Miller Park
2245 Callaway Road- Building "B"
Marietta, GA 30006

There are NO admission or auction fees whatsoever. The facility will open at 7:00 AM for dealer set up. Dealers pay $15.00 for each 8 foot table and one chair (see web site below for table pre-registration option). No sales will occur before 8 AM.

This year we will feature:
* Door Prizes
* 50/50 Cash Raffle
* Contest with prize ribbons awarded in three categories: Pre-1930's Radios, Bakelite Radios and Radio/Phono Combo Sets
* Guest Speaker is Les Cane, Topic is Medical Quack Devices (this promises to be hysterical)
* food is available (donations appreciated)

We expect RADIORAMA 2013 to be our biggest and best event yet.

The Southeastern Antique Radio Society is hosting their 2013 INDOOR Winter Swap Meet and Auction at Jim Miller Park, 2245 Callaway Road in Marietta, GA on Saturday, February 23.

This is our premier event of the year and one of the largest Swap Meets in the south. We expect to have at least 50 vendor tables so this may be our biggest event - ever!

The event is FREE to all buyers. Tables are available to sellers at $15 each. Sellers can optionally pre-reserve 8 foot tables using PayPal at the web link below. No sales before 8 AM. We'll have an auction, guest speaker, radio contest, door prizes and 50/50 cash raffle. Coffee, donuts, pizza and soft drinks will be available (donations appreciated).

The Swap Meet and Auction will end at 1:30 PM so be there at 8 AM sharp for the best selection of antique radios and electronics.

Subject: [AMRadio] AM Rally **THIS WEEKEND** Feb 16, Feb 17
Date: Wed, 13 Feb 2013 12:15:55 -0500
From: Steve WA1QIX <wa1qix@...>
To: amradio@...

This weekend is the annual AM Rally.

The event takes place starting at 6:00 AM E.S.T. on Saturday Feb 16, and goes until 11:00 PM West coast time (that's 2:00 AM on Monday, East coast time).

If you can send in a log (we have free logging software customized for the event), that would be great, but this is an operating event, so just get on - log or no log.

The event has a web site at http://www.amrally.com with complete information, rules, links to the logging software, etc.

Look for you this weekend! *** Please tell everyone you know about the event when you're on the air. A surprising number of people don't read Internet web sites or mailing lists, so the only way they can find out about the event is by hearing about it. Thanks!!

12134. Wanted - This farm radio speaker - rusty or open OK

Yahoo group: antiquewirelessassociation (2010 — 2015)

From: Robert
Topic: 12134 Message: 12134

I want a Wright-DeCoster loudspeaker like the one at the URL below to take apart. It can have a torn cone, somewhat rusty or open coils but the mechanism must still be there... This one is for push-pull operation... Single ended output version would be OK too.

Got one in your junk box to offer?

There is also a Quam speaker similar in construction that might work OK

http://antiqueradios.com/forums/viewtopic.php?f=15&t=216116

Thanks,
Robert

12142. January Journal Delivery Survey

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2013-02-16 17:20:11 UTC
From: Marc Ellis
Topic: 12120 Message: 12142

Hello group--

I've seen all the queries regarding non-arrival of the January AWA Journal.

This is to assure you that the issue was definitely sent out abvout a week before the end of last month, but since we use the non profit organization mail rate as an economy measure, delivery is slow.

To help me evaluate the situation I would much appreciate it if all AWA members in the group would take a moment to send me a yes or no report on the delivery status of this issue. Please include your location and -- if you have received the issue--include date of arrival.

Please respond directly to my personal e-mail address with "Journal Survey" in the subject line and send a report to me even if you have already posted a comment to the reflector.

Thanks in asdvance for your help!

12143. New Yahoo group for Spark Gap Collectors

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2013-02-16 18:02:36 UTC
From: w6adv
Topic: 12143 Message: 12143

For those of us who collect and are facinated by the earliest spark transmitters, and receivers, I have launched a Yahoo Group.

Here are the details on SparkGapCollectors:

Group home page: http://groups.yahoo.com/group/SparkGapCollectors
Group email address: SparkGapCollectors@yahoogroups.com

I would encourge collectors and historians to share your photo collections and help establish a forum for the exchange of information, and help in identifing those unknown brand items.

Thanks,

Craig

From: Robert
Topic: 12153 Message: 12153

Is the Journal so time critical that the organization should be spending for First Class?

I have my doubts about that. With finite revenue I think it reasonable to have made the switch to 'slow boat'.

If a .pdf of the latest issue were available to CURRENT AWA MEMBERSHIP ONLY that would be a good thing too.

Robert

Well, Feb. 21, another day, another non-arrival of the "Journal."

Maybe AWA should concentrate its scarce editorial horsepower on getting the magazine out on time, rather than throwing it away on silly piffle like the "Gateway."

Or, maybe that's the long-term strategy: kill the print publication and hurl content onto the Web? THINK of the money it'd save!

My guess is no, because I got screwed out of the yearly review because my renewal was late. One reason I will no longer be a member of the AWA, even though I have since the 70's. No, I still haven't received the journal yet here in NV.

12190. Need Quadraphase article from Apil 1927 issue of RADIO

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2013-03-05 16:12:35 UTC
From: Robert
Topic: 12190 Message: 12190

Folks,

Need Quadraphase article from Apil 1927 issue of RADIO. Seems to be the only '27 issue of RADIO I don't have. Can you scan or make a snapshot of the pages?

BTW - I LOVE my old Mustek A3 USB large format scanner. The current model should be even better and is still less than $200.

http://www.amazon.com/Mustek-A3-1200S-11-7-inch-16-5-inch/dp/B008Y8E1XC/ref=dp_ob_title_ce

Some reviewers pan these units because they have a 'contact' sensor that does indeed have a very narrow depth of field. But unless you are trying to scan a thick old book with really crinkled pages, this is a non-issue.

Also others pan the color controls... NUTS! I just use the TWAIN driver to bring it into Photoshop or Photoshop Elements and tweak to my hearts content. Check out my color scans on magazineart.org that were cleaned up by Michael Ward.

Folks,

I am looking for proof that any HARD RUBBER cased - 6 VOLT - Specifically identified for use as RADIO "A' BATTERY still exist today. (Either marked as such on the case or positively identified in sales literature as designed for such service.)

I am interested in making a museum exhibit grade replica of such a battery. I have a 90(?) A/h RADIO "A' hard rubber cased battery made by Willard that almost exactly matches a picture in a 1926 issue of RADIO.

I can make a replica of this battery but would also be interested in making a replica of an earlier 6 Volt Radio "A".

I do not know when the first hard rubber cased RADIO "A" came to market. The only alternate brands that seems to have had consistent advertising are GLOBE, WORLD, EXIDE.

Comments welcome.

Robert

Robert - you have an interesting project going. Not much of the period left in my library. i did find in the Mar 1925 issue of Amateur Radio, an obscure magazine, an adv for Westinghouse "A' batteries. 70 A.H., $11, 100 A.H. $14. no photo.

Everyone,

I received the email below. Is there anyone in the Grenville, SC. area that will restore a RCA 5T1 for the Uncle of a friend?

Thanks
Tom

Subject: [smithchart] RCA 5T1 Resoration?

Hey yall,
Was at my uncle's this weekend. He has his RCA 5T1 from childhood that he would like to get restored. It's a table model, built in the late 1930's, AM and SW bands.
Didn't know if any of you did this, or knew someone who did this..or, if it was possible to restore this rig?
I didn't fire it up, probably bad caps.
He's in Greenville, SC.
Tnx,
Bob RLC

Robert, Please let me know what you find out. I am interested in doing the same thing. I am also putting a standard battery in a conntainer that I have. Also, I want to put some of the old radio batteries like were in cardboard containers. That is opening up the cardboard container and putting in newer readily available batteries, mainting the original terminals.

ANNUAL INFOAGE RADIO ELECTRONICS AUCTION

Saturday April 27, 2013

InfoAge Science History Learning Center and Museum
2201 Marconi Road
Wall, New Jersey 07719

Huge Radio/Electronics Auction Conducted By The
New Jersey Antique Radio Club and The Radio Technology Museum

All day sale of vintage radios, electronic test equipment, ham gear, audio equipment, marine radios, military electronics and 1000's of vacuum tubes along with related parts & documentation. Large variety of tubes in box lots, groups or singles; many interesting types. Better tubes are pretested. 300 + lots, including many large box lots. Something here for every radio/electronics collector.

Auction Begins at 10:00 AM on Saturday
Viewing is from 8:00 AM to 10:00 AM Day of Sale

Sale of artifacts and donations excess to the centers needs. Proceeds to benefit InfoAge, Radio Technology Museum and National Broadcasters Hall of Fame.

Auction is indoors with ample seating. Noted radio auctioneer Richard Estes will be wielding the auction gavel. Complete auction catalog available two weeks prior to sale. Terms are cash or good check, sorry, we cannot take credit cards. 5% buyers premium is charged.

Directions: http://www.infoage.org/visit#directions
Up-to-date Information: http://www.ar88.net/auction.html
Auction Contact: auction@... or 908-757-9741

From: N2MHO
Topic: 12224 Message: 12224

That's what it says here:

http://www.theatlantic.com/business/archive/2013/04/the-10-most-common-and-10-least-common-jobs-in-america-today/274526/

the article doesn't define what they call a "radio operator," however.

From: Al
Topic: 12225 Message: 12225

I would like to give-away a copy of The Perpetual Trouble Shooting Manual, Vol 1, by John Rider. I am unable to find a copyright date to determine age, but it does cover early A/C sets and so I would guess the manual dates from the late '20's.

If you should like to have this manual, tell me just why you wish to have it. I shall email direct the person offering the most the most convincing response. I am requesting to be reimbursed for the mailing costs, a check to be mailed to me after the receipt of the book which weighs about 7lbs.

Hello Al -

My dad got his first job as the radio serviceman for the local Philco dealer in 1935, when he was barely 19.

As soon as he was able to afford it, he subscribed to Rider's service. He told me that he started with Vol 2,

because the sets In Vol 1 were pretty much obsolete by that time. Hi died in 1977. I still have his Rider's

collection, Vols 2 thru 22.

He skipped Vol 23 because Sams Photofacts had all but taken over by then, and were superior by most counts.

I would love to have your Vol 1 as a step toward completing my Rider's collection.

Today I'm 68 and retired, and occasionally find time to work on old radios. Late 30's Zeniths are my favorite,

although I do have a few from the Vol 1 era - AK Model 20's for example. I'd be happy to pay the postage if

you choose me to have your Vol 1.

Thanks for your consideration!

12229. 432 KC Crystal

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2013-04-06 14:32:31 UTC
From: mistertransistor500
Topic: 12229 Message: 12229

I purchased a Breting 12 receiver at the this spring's CC-AWA Charlotte Show. The radio is currently being restored. One huge disappointment was the receiver was missing the 432 KC crystal used in the IF filtering circuit. I know this is a long shot, but does any group member have such a crystal they could part with? I can be reached directly using the email jbarnard "at" ftc-i.net. Thanks, Jim W4BRX

Jim,

Are you after an exact replacement for restoration, or would any crystal near 432 KHz, just to make the xtal filter in the rcvr work again, suffice? If the latter, I'm pretty sure there are WWII surplus FT-241 xtals "out there" that would work. I bunch of guys on the "Glowbugs" Email list on googlegroups went together on a large quantity of these some years ago, and chances are good that someone reading this will come forth. These had a high failure rate, though, so would suggest getting several to improve your chances of finding a good one, or see if the provider can test it first.

73,
-Larry/NE1S

OK. According to a response on the Glowbugs list from N4JVP, the corresponding FT-241 would be for "Channel 311." There should be some of those "out there."

12238. AWA 2013 Convention Registration is Open

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2013-04-11 03:56:38 UTC
From: Roy Wildermuth
Topic: 12229 Message: 12238

On-Line registration is now open for the 2013 AWA Convention. As is our custom, we will mail out Convention credentials for those registering either on-line or by mail by August 13.

A new system for 2013 will permit us to mail out registration credentials upon receipt of your registration.

Registration cards will be included in the next two issues of the AWA Journal.

The 2013 Convention will be the Grand Opening of The New AWA Museum. Attendance to the Ceremonies will be included with your registration and will include complimentary refreshments. The Canadice String Quartet will be playing. See the Convention Web Page for details.

The AWA 2013 Convention. Don't miss it !

I purchased a Breting 12 receiver at the recent Charlotte, NC meet of the CC-AWA. It is now playing quite nicely. Here is link to the restoration Webpage that I have posted: http://www.transistor-repairs.com/Breting12.html. That pair of 42 audio tubes produces a rich "tube" audio.

12245. AWA Journal Release Schedule -- Spring Meet and Meetings Info

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2013-04-18 17:10:16 UTC
From: Marc Ellis
Topic: 12245 Message: 12245

To the group--

I'd like to
thank everyone who provided data for my
recent AWA Journal delivery survey. What
I discovered is that as late as a month
after mailing some members had still not received their January issues. Unfortunately, in this era of skyrocketing postal costs, first class mailing is no longer an option and we have to mail using the cost effective, but much slower, non profit organization mail.
As you might imagine, the change from a delivery schedule of just a few days to one that takes over a month has upset various writing and editing routines that have been established for over a decade by not only myself, but by the many other individuals--writers and production people--whose efforts go into getting the latest Journal into your mailbox.
On top of that we have added an additional quarterly
publication, The AWA Gateway, to our release schedule. This free on-line publication provides basic information on vintage communications and is intended to attract more people to our hobby.

In time we will develop new routines, but considering that your Journal has an editorial timeline of three weeks (or more--if manuscript submissions are late) and requires two weeks for printing and mailing , followed by a month or more in the hands of the Postal Service, it is difficult to provide crisp delivery of a dated issue.
For that reason. we are switching from designation by month to designation by
season which, in any case, is a very appropriate plan for a quarterly
publication. The upcoming former April issue, which will begin reaching members in late May, will be the Spring issue. The following issues will be Summer, Autumn, and Winter.

Of course the content of our publication is anything but time sensitive--except where it is important to provide information about upcoming AWA events. And as it happens the Spring issue will arrive too late to repeat the current information about the AWA Spring meet and Board meeting. In the future we plan to tighten the schedule so that this does not happen but for
now here is the information:
The AWA Spring meet, Membership and Board meeting will take place, as usual, on the first Saturday of May (May 4 this year).
Enjoy the yearly sale and auction, tailgating, presentations, and refreshments. At the former AWA Museum Annex building in what is now the Bloomfield, NY Veteran's Park 6920 Routes 5 and 20, intersection with Route 444, and also in the former American Legion Building at the same address. The "Annex" doors open at 7 a.m. for seller setup; both buildings open to the public at 8
a.m.

The Member and Board Meetings begin about
1 p.m. at the Media Center (Building 2) on the new AWA Museum campus, which is across the

road from the "Annex" building..

From: Bill Stewart
Topic: 12246 Message: 12246

Good Afternoon,

What old radio magazines would you all consider to be the best for having good, practical articles on

technical info of the time, rcvrs/regens and transmitters for amateur use. The 1920s & 1930s would be the years of interest. I would not be interested in magazines dealing with swling and/or the BC industry. I have most of the 1935 issues of 'Radio' with a lot of Frank Jones articles, and would think that magazine would be high on the list. Any others in that same vain? (I have plenty of QSTs).

Thanks..73, Bill K4JYS

"OTB" Vol. 34 No. 2 (May 1993) had a story on rewelding - maybe - open filaments on 100THs, 250THs, and such by applying a 12-volt battery charger good for eight amps or so and tapping on the tube. There was some extra process like reversing the polarity after the filament rejoined, and aging it at reduced power.

There was also some rah-rah in the radio-repair press during WW Ii about healing 50L6s and such by applying current-limited higher voltages but I don't have a reference handy.

Good luck!

12254. Tube collectors... RCA Experimental Tube

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2013-04-27 04:28:09 UTC
From: w6adv
Topic: 12254 Message: 12254

I acquired a batch of interesting mini CRT tubes in an estate auction of a scientist.

Most of them I have put on eBay, however one is an RCA 1 inch CTR experimental tube C73619 with all the experimental stickers and numbers that appears to be NOS.

Based upon what was written on the box, this later went into production as a 1EP1

If there are any tube collectors who might be interested in this tube, please contact me directly to discuss.

WELL !!! I've completed 11 more replicas of the Eveready 486. These have graphics that are pretty close to spot-on as far as color rendition goes although these shots were made without a white balance check so it is still difficult to prove it here. I may eventually strip off the graphic on the first three for an upgrade. When I get around to it, I'll make some web pages to show the build process. Even with jigs now built I doubt I can make one in less than 4 hours... There are just too many fab steps to get to this level of reproduction accuracy when turning out a build of 12...

But at least I have some pretty good replicas to show with my exhibits over the next couple of years and I plan to donate the rest to museums if they want them. I need to move on to a couple of other restorations before considering other replicas.

There are only three loose wires to the Fahnestock clips... Put whatever you like into them if you want.

Why would you put rechargeable batteries into a 45 Volt battery pack? Who is going to put many hours run time into a mid 20's radio over an over?

Five alkaline 9 Volt transistor batteries in series will yield 450 mA/hour.... If you have the 'C' bias set right on your 5 tuber, that should give you upwards of 20 hours of 'demo time'. More than enough for a weekend exhibit or several years of demo in your home to visitors...

Neat! I did some repros of some Burgess batteries that came out pretty well, but not as good as your Evereadys. They're shown with my Mk.19 mini regen in the Regernrx photo section. Unfortunately, I lost the scans so I can't make any more.

Photos at this link...
http://antiqueradios.com/forums/viewtopic.php?f=1&t=217577&start=40

WELL !!! I've completed 11 more replicas of the Eveready 486. These have graphics that are pretty close to spot-on as far as color rendition goes although these shots were made without a white balance check so it is still difficult to prove it here. I may eventually strip off the graphic on the first three for an upgrade. When I get around to it, I'll make some web pages to show the build process. Even with jigs now built I doubt I can make one in less than 4 hours... There are just too many fab steps to get to this level of reproduction accuracy when turning out a build of 12...

But at least I have some pretty good replicas to show with my exhibits over the next couple of years and I plan to donate the rest to museums if they want them. I need to move on to a couple of other restorations before considering other replicas.

12281. Tomorrow at Spencer - Need Baldwin earphone

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2013-05-17 20:59:39 UTC
From: Robert
Topic: 12281 Message: 12281

If you have a single Baldwin earphone in your junk box, I'd like to buy it tomorrow... I don't need the ear cap and the mica diaphram can be trashed. It would be nice if the coils were OK but don't have to be.

Want to build a microphonic amplifier as mentioned in the January 1925 issue of The Experimenter. I have two or three fine sets of 'Baldies' but can't trash them for this...

Thanks,
Robert

12283. Need Bristophon instruction sheet - The Bristol Co. ca. 1925

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2013-05-24 01:41:36 UTC
From: Robert
Topic: 12283 Message: 12283

Folks,

A couple of decades ago I acquired a Bristophon phonograph attachment. This is basically an electromechanical phono amplifier. You connect a 6 volt battery and horn speaker to the device. The phono head is basically a double button carbon microphone element attached to a phonograph needle. There is a transformer in the device that matches the low impedance of the carbon mike circuit to that of a typical (I think) horn speaker.

When I got it about 20 years ago it had a problem. There are two ring washers made out of white felt that hold the carbon grains in place. Insects had eaten enough of the wool felt to allow all the grains to pour out!

Fast forward to yesterday.... I came across a little pill bottle containing a tablespoon of carbon granules.... I have no recollection whatever as to when I got it.... Anyway I decided to fill up (almost) the Bristophon head and give it a try... It does work, but the volume out is 1/3rd what I would think should be considered good for the typical horn speaker of the day.

What I would like to know is if The Bristol Company that made the Audiophone Junior & Senior had any special requirements for horn impedance. I know that the Brown Microphone Amplifier I have is designed to work with a 120 Ohm horn, not the typical 2k/4k impedance horns that would have been the load for a 201-A.

So, any chance you have an instruction brochure for this device or any experience in operating your own outfit?

Thanks,
Robert

> First, do you know the type of veneer you need? Flat cut (rotary peel of the log) or quarter sawn? Will need photo of another set to know that.
>

Thanks for the input Robert,
below are some pix of the set and the broken knob.

The wood on the top that was under the veneer is nice, looks like
birds eye maple...
The pix of the set showing the underside of the lid might be a good
indication of what the top looked like, except it's MUCH more shiny than
the rest of the outside is.
I really hope to keep the majority of the original finish intact.
The is one more spot that'll need some attention, there was a big chip out
of the skirt on the bottom front, the old ham that gave it to me started
this repair.
It's neat that it still has a full set of WSL 01A tubes in it and it's
an original Charlotte radio.The old ham got it from he said an old lady
that had lived in Charlotte her whole life and it had been her families
radio.
you guys it other parts of the country might not think it's much to find
an original set to your town, but down here in the south there weren't that
many radios in the 20s. One of the Charlotte newspapers did a survey in 1924
that said there were 400 radios in Mecklenburg county, that's the county
where Charlotte is located. When you consider how many were thrown away,
recycled or turned in for war drives, there can't be many originals left :(

Below is also a picture of the broken knob.

Does any one have a set like this that still has the original finish on the
top so I could have something to try and match?

Sorry for the long post, thanks for reading and looking at my photos.

If an original knob is unobtainable, it would seem to be an easy fix to repair yours. An impression of part of the knob skirt that remains cold be made, coated with mold release, positioned over the area that is missing, and a layer of black epoxy putty forced into the mold. Just a thought.

Hello,

Does any one know what years the "Philmore Super Radio Crystal Set" was made? Cat. No. 7001.

My brother in law found one and shipped it to me. Its in the original box and its in good condition. I connected it to my 160 meter antenna and picked up WHRI, a 100KWw station in SC. It was on 5.920 kHz.

Thanks
Tom, N4TL

Tom,

There are two pretty good reference books on crystal radios..... Crystal Clear, Vols 1&2. They have some pretty good insight to Philmore and some of the sets produced by them. The one you describe is likely from the late '40's through the late '50's. Philmore made a slew of crystal radios. Some of the earlier ones were metal.....later on, plastic in everything from brown to swirled colors emerged. I'd guess your radio is plastic with the crystal exposed under either a glass or plastic cover. With a slider at the bottom and Fahnstock clips for connecting aerial, ground and phones. Hope this helps some.

Radio Fans,

Radio Station WA2XMN - Armstrong FM - 42.8 MC - Alpine, NJ will be on the air Monday, 17 June 2013 to cover the dedication of a commemorative plaque near the site of Edwin Armstrong's boyhood home in Yonkers, NY, at 1 PM. We're hoping to begin broadcasting at approximately 11 AM. (Please bear with us, this is an experimental station.)

Details at: http://www.wa2xmn.ar88.net/yonkers.html

Some press coverage: http://www.lohud.com/article/20130614/NEWS/306140143/Yonkers-honors-hometown-man-who-invented-FM-radio

Warm up your radios,
Al Klase - N3FRQ

From: David
Topic: 12315 Message: 12315

I came accross an RCA AVR-11 Airport Receiver which I will be restoring. I am looking for an original manual to go with it. I do have a copy but that just won't cut it.

I posted a picture: http://groups.yahoo.com/group/antiquewirelessassociation/photos/album/1852163338/pic/188319724/view?picmode=&mode=list&order=ordinal&start=1&count=20&dir=asc

If you have one laying around, please do let me know.

Hi Allan--

I viewed the video and found it very interesting--though on my computer at least, the audio was quite broken up.

Would you or another member of your group be interested in doing an update for the Journal on the restoration activities on the North Carolina radio room and antennas? It would make fascinating reading for our members!

Looking forward to seeing you at the Convention--

Marc

From: Al
Topic: 12325 Message: 12325

Folks,

This much-delayed Armstrong event is back on the schedule.

2013 marks the 101st anniversary of the development of the regenerative radio circuit by Edwin Howard Armstrong an electrical engineering student at Colombia University. This invention not only greatly improved the performance of radio receivers, but would also become the basis for modern radio transmitters, making voice transmission, and radio as we know it, a reality.

The New Jersey Antique Radio Club's Radio Technology Museum will host an observance of the occasion at the InfoAge Science History Learning Center and Museum in Wall Township, NJ on July 27th and 28th, 2013 from 1 to 5 PM. There will be a display and demonstration of a wide range of vintage regenerative radio receivers with a formal presentation at 3 PM.

See: http://www.rtm.ar88.net/Armstrong_Days_at_InfoAge.html for Details.

The NJARC Summer Swap Meet is the morning of the 27th, so radio fans get a two-fer on Saturday.

See you there,
Al Klase - N3FRQ

I had just last weekend been pointed too, and read, and interesting
article on the web entitled "Sixty Years of Lafayette Radio" by KB8TAD:
http://www.ohio.edu/people/postr/bapix/LafArt_60_3.htm

The follow-up article is also extremely interesting:
http://www.ohio.edu/people/postr/bapix/Laf_spies.htm

Toward the end of the first article I found the attached. Not sure of the
page number, but I think it's what you are after.

73,

Thank you for posting the link, Al.

I enjoyed this discussion very much, not only for the correct pronunciation of the names of many radio pioneers, but for its in-depth thoroughness in covering the subject of the development of wireless telegraphy. The panel's inclusion of Bengali scientist Sir Jagdish Chandra Bose' 1899 development of his iron-mercury-iron coherer (employed by Marconi in his 1901 transatlantic wireless receiver) and David Edward Hughes' 1879 discovery of electric spark generation of radio waves contributions are particularly welcome, however the omission of American physicist and inventor Amos Emerson Dolbear's 1882 demonstration of wireless telegraphy and Temistocle Calzecchi Onesti's pioneering first experiments with a predecessor of the coherer in 1884 is a little disappointing.

Students of the history of the development of wireless telegraphy will find this concise and remarkably complete Wikipedia article of interest for its mention of many other little known contributors: <http://en.wikipedia.org/wiki/History_of_radio>. Don't overlook the list of Radio Pioneers under the 'See also' heading.

Lud,

It appears that your SpamCop e-mail filter software is filtering out mail from
Ron. Perhaps you could "White list" Ron's e-mail address to instruct SpamCop
that it should not prevent delivery of his messages.

Best regards,
Larry

It's likely SpamCop is configured on your ISP's mail server, not your computer.
You should have access to SpamCop setup via your ISP's Web-mail interface
perhaps.

Ron -

What this means is that ONE of the 'relay' stations between you and Lud is running SPAM_COP, and has 'black-listed' your ISP. This is
usually the result of spam complaints, and unless it's a chronic problem will clear in ~24 hours.

If you go to the address below, it will explain why. You'll have to complain to your ISP and they'll have to request that the block be lifted.

Subject: [Milsurplus] Night of nights

Hi,

There will be transmissions from some of the old maritime coastal
stations Friday night. Details are here:

http://www.radiomarine.org/gallery/show?keyword=nonxi&panel=pab1_5#pab1_5

I will be putting my BC-453 online to hunt for the transmissions around
600 meters. I'm afraid my RAK is deteriorating from age (tubes, caps,
resistors?) and I'll do some "A/B" type comparisons against the BC453
which has been working very well. Once upon a time I used those coastal
stations to build up my Morse proficiency. So tomorrow will be a
nostalgia event.

73,

Bill KU8H

12352. Wanted catalog page scans for Heathkit XR-1 transistor radio

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2013-07-17 01:06:42 UTC
From: Robert
Topic: 12352 Message: 12352

I have the manual Susan Latta used to build the radio and have been to the Heathkit Virtual Museum to see their info...

What I would like to have is a scan of actual pages(s) from a 1957/58 Heathkit catalog. From the looks of the HVM info, there was some reformating from what I would have expected to see on a catalog page of the day.

Robert

12353. "It Is Time to Nominate . . ."

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2013-07-18 03:17:18 UTC
From: Ludwell Sibley
Topic: 12353 Message: 12353

Well, a week ago, thinking about this year's awards, I called up one of the Awards Administrators with the idea of writing a nomination for a highly qualified, particularly deserving candidate. Asking if anything was going on as to nominations, I was advised that the matter had been decided back in May. Nobody had submitted a nomination, so the award won't be given this year.

Next day (Thursday), the "Journal" came in with the traditional announcement: "It is time to nominate candidates for six prizes to be given at the AWA 2013 Convention." Following tradition, no due-by date is given. Also following tradition, no medium faster than snail-mail is cited for five of the six awards.

Now, I suppose there's some improvement here. Last year, the announcement came in on August 5, just days before the Conference and a few months too late. This year, it's just a few w-e-e-k-s too late.

The upshot is that you, fellow member-humps, have gotten the ol' AWA Awards Tease as to whether you have influence over the process. And my prospective nominee has gotten screwed out the chance for an award.

This is not to sneer at the Administrators, who are simply intake filters for the Mystical AWA Process.

But as for you fellow members, if you had a writing a nomination in mind, fuhgeddaboudit.

Lud,

I think this is just symptomatic of the problems of the new and improved AWA. IMHO, which could very well be wrong, the focus of the AWA has slipped greatly from what once attracted all of us, or many of us, from what we admired and aspired to be a part of - an organization of kindred souls interested in "all aspects" of old radio, to include my beloved flea market of the days of olde.

The museum, which was a very important component of the AWA organization, and well should be, has, IMHO, taken center stage at the expense of the organization and the wants, needs and wishes of a large component of the organization.

In retrospect I wish I had not been involved, complicent, and complacent in the demise of ARCA. That organization formed a counter-balance to AWA and I think they kept each other a little more on their toes and responsive to the needs and wishes of their constituency.

I was involved in the formation and running of another "Antique Radio Club," or two and we made the conscious decision to keep the "club" and the "Museum" distinctly separate. AWAS chose not to do that, but to combine, and I truly believe the "organization" suffered greatly from that decision.

That is why I chose to no longer be a member of that organization.

I wish them well, they simply do not cater to my needs, wishes and desires, and I find I still derive much enjoyment from this hobby through other outlets and organizations.

Your email and most recent experience does not surprise me - it only confirms what I have believed.

Sadly,,

Joe

Not good timing at all.... I put in a nomination back in May for one of the major awards... I kind-of thought I might get some comformation that my nomination had been received... I did not. A couple of weeks ago I was thinking about that and did send off a query and yes it was received and will be given consideration.

At a minimum, I think, the calls for nomination ought to appear in the Winter and Spring issues of The Journal AND some sort of verbiage that says that nominations not received by 'x' date will be rolled over to the next years call.

Considering that the AWA Conference comes at the tail end of Summer travel and other family events really complicates coordination of club activities this time of year... A month between nominations and announcing the award is just not enough time.

Robert

FYI.

These will no doubt be out of our price range, but it's still good to see some vacuum tube manufacturing resuming in the US. Helps keep the art alive...

Folks,

2013 marks the 101st anniversary of the development of the regenerative radio circuit by Edwin Howard Armstrong an electrical engineering student at Colombia University. This invention not only greatly improved the performance of radio receivers, but would also become the basis for modern radio transmitters, making voice transmission, and radio as we know it, a reality.

The New Jersey Antique Radio Club's Radio Technology Museum will host an observance of the occasion at the InfoAge Science History Learning Center and Museum in Wall Township, NJ on July 27th and 28th, 2013 from 1 to 5 PM. There will be a display and demonstration of a wide range of vintage regenerative radio receivers with a formal presentation at 3 PM.

See: http://www.rtm.ar88.net/Armstrong_Days_at_InfoAge.html for Details.

Our Summer Swap Meet is the morning of the 27th at InfoAge, so you get a two-fer.

See you there,
Al Klase - N3FRQ

Topic: 12361 Message: 12361

I have used Go-Jo or Goop waterless hand cleaner for decades to clean radio cabinets and Bakelite parts. Was running low so went to the local autoparts stores (Autozone and Advance Auto) and found to my horror that it was gone! Replaced with versions that now say 'contains no petroleum solvents' and 'now with Aloe', even ones with new cherry or orange fragrance.... EeeK!

Much to my relief I found it at O'Reilly Auto Parts.... But I'm wondering how long it will even be there....

I'm thinking that the new formulations would have water in them and be useless for cabinet cleaning... Your thoughts?

Robert

Robert -

Doesn't look good. Amazon still lists both Go-Jo and Goop, but both have "ONLY XX LEFT IN STOCK" notations. Usually a message like that
says 'more on the way', but not in this case. Looks like both have been discontinued.

No way to tell if the new stuff works for our use, Murphy says "Probably not!" :-)

Yeah I had trouble finding it last spring, I finally found it
at our local Ace hardware, they also have Old English.

I wonder what we can do to prolong it's shelf life?
It eventually liquifies. I'd like to stock up if it would keep.

Back during the (BIG) war one of the popular books was "Henely's Chemical Formulas." It listed formulas for a lot of products that that weren't available because of the war. We even made photographic paper with info from the book. There may be formulas for Gojo, etc., available somewhere. I've been making my own "Q Dope" from styrofoam packing and toluene (when I can get it) or MEK & Xylene. There's all kinds of stuff on the internet.

From: Lee
Topic: 12361 Message: 12373

Please allow me to first apologize for repeating a topic which has no doubt been well-discussed on many previous occasions; however, an archive search has not proved as easy as hoped - so may I offer that if everyone would be so kind as to briefly offer a few of their favorite products/methods for rejuvinating original cabinet finishes, I will summarize the responses in a poll through which members may then for the record rank their preferred approach.

In my case, I've a few wood cabinets in very nice original condition, but need refreshing. What product/technique(s) are best to remove grime build-up around & on the dials (G0-Jo, of course being one). Similarly, what is the best way to bring a new, deep luster to the original finish? What steps do you prefer in utilizing these products?

Feel free to reference previous archive post #.

Thank you!

Count me in as a GoJo enthusiast. It usually takes multiple applications to get all the schmutz off, but it's quite rewarding. Works on painted metal too.

I've also had good results with car-body polishing compound (the finer-grit version) on Bakelite cabinets.

I have not done a lot of cabinet work but the three or four I have cleaned with Liquid Gold have come out looking very good. I didn't bring the can of pourable L-G with me when we moved in 2000 and when I looked for it in the past couple of years all I can find is the aerosol version which I have not tried on cabinets but I suppose it'd work as well but just be messier.

Regarding the change of hand cleaner from cream to liquid, I used to use a local brand of cleaner back in Buffalo - It was called DL hand cleaner - but it would eventually become a liquid and still cleaned hands just fine, just was harder to use without dripping on the floor. The snap on plastic lid of the can let moisture in slowly, I think, and that caused the change. I found an old ad for it on line and it says it contained lanolin. If GoJo also has lanolin perhaps that would "Moisturize" the wood better than the fairly volatile materials in Liquid Gold but the Philco 1939 floor model in our bedroom still looks wonderful 20 years after I cleaned the crud off of it with L-G.

Hello all,
My first question is was Bakelite used in the mid 1920s for panels, etc?
I've seen the term 'hard rubber'...was that something that was used for
panels, etc during that time?

I was doing some surfing looking for something that would look and
work like the old Bakelite for small panels and term. strip construction.
McMaster-Carr has a mtl called Garolite and can get it in black.
Anyone used this as a sub. or do you have a better mtl. I'm not picky,
so if its close I would be happy.
Tnx...73 de Bill K4JYS

I'm not picky either. I've used black (opaque) Plexiglass with some success. Check your local yellow page listings under "Plastics." At one time it was posible to go in and rummage through their scrap bins but now they site "insurance" concerns.

I like the black acetal copolymer from McMaster. Machines beautifully
and polishes to a high luster if you wish. I have used the garolite but
it's actually more like micarta and the edges caused by machining will
show the ends of the fiberglass cloth that provides its strength.

http://www.mcmaster.com/#acetal-sheets/=o092zm has the sizes and prices
for the acetal.

73,
- Mike

Bill - hard rubber was used pre-WW 1. only bakelite was used in the 1920's set. Both are hard to find unless you buy a 4 x 8 ft sheet, which get pricey. Black plastic is a substitute.

The hard rubber used in the old days was usually called ebonite. It is a good insulator for DC and low frequency AC. Bowling balls, railroad telegraph insulators, knife switch bases, and wheel castors were made of it to name a few. It is not an insulator for RF voltages. I smoked an ebonite knife switch stuck in my antenna's tuned feeder lead-in. A microwave oven will burn it.

I have in my collection a number of 20s broadcast radios with hard rubber panels. In the photos section I will post a photo of the branding on the back of an ERLA Superflex panel (circa 1924). There are adverts in the popular mags of the day specifically identifing them as hard rubber not the more expensive phenolic resins like Bakelite.

Robert and Ed - i stand corrected. i know my RJ-6 had a hard rubber panel. Some of those panels would turn brown and often warp, whereas as Bakelite seldom did.

Our shop teacher in JR HS in the '60s used to keep the class provided with all kinds of scarp from a plastics place... yea if you can befriend one of these places they are wonderful.

It just may take a while to make friends and prove you can walk without tripping etc etc.. Don't give up! Even in this age once you become a known quality people will allow yo to scrounge!

From: Gerald Cromer
Topic: 12389 Message: 12389

I'm in need of the power connector that goes on the end of the power cable for a RAS-5 made by National Radio. I think that the connector was made by AH&H and was a part number 7054. I also think that Amphenol made the same thing and their part number was 61-F11. This AC connecter is round and is a dual female that plugs into a chassis dual male and goes on the end of the AC power cable. Does anyone have one or a power cable that they'll let go of.

Attachments: 8 described; binary payloads are missing from this source WARC

Anybody interested in a Crosley Prestotune 11 console. Cabinet needs to be refinished but has no damage. All the knobs are missing but all the pushbuttons are there with most of the station labels including WBT. The chassi is complete but needs a lot of work. The speaker is there but I haven't checked the condition yet.

Does anybody have use for a Callbook or several Callbooks? The following are available here:

1938 Summer (Vol. 19 #2), worldwide, cover replaced with new white card stock, binding tight

1954 Winter (Vol. 32 #4), worldwide, cover slightly chewed up and reglued, has gotten wet so pages are crinkly

1982 (Vol. 60 #1), foreign listings, tight binding, front cover lightly discolored

1983 US listings (Vol. 61 #1), tight binding, cover lightly discolored

1983 US listings (Vol. 61 #1), tight binding, cover moderately discolored (second copy of above)

1984-85 US listings (ARRL production), binding fairly tight, cover has a couple of corners missing

These are clean and non-moldy. They were given to me, so you can have them for the cost of postage (they "contain advertising" so don't qualify for Media Mail). "Take them all" responses are preferred, but I could part them out. Pse email me directly (tubelore@...) rather than occupying the reflector.

Hi Lud,

Got home after dark last night - beat from the drive - went to unload the car only to realize a 500-800 lb tree branch across the roof of my shop... All morning figuring out how to remove it without killing me or the roof... Down to a 300-400 lb section suspended between two ropes and the roof too hot to continue. The good news is there is no obvious damage to my way overbuilt roof other than a few scuffed shingles.

Will report maybe tonight..... Will I be back? Of course... after 40 years I wouldn't even know how to stop :<)

My thoughts on the 2013 AWA Convention

Still the best historical communications conference going on anywhere

Tuesday afternoon at 2PM marked the official ribbon cutting at the AWA Museum. I thought there might have been about 150 people there in the first two hours. The front third of the building is available for viewing. There is an oval hallway with a number of alcoves. In each alcove is a different theme. A good way to introduce John Q. Public to the historical progress and diversification of communications technology.

There is a large alcove for the 1920s radio store, the Clapp-Eastham rotary spark TX is set up to inject ozone into the air, a teletype is spewing out news, a late 40's TV is up and running, etc.
All good first steps in a project that may well take five years to build-out fully. I got a peek into the back end of the building to get the full impact of what this crew of mostly volunteers has done in a relatively short time. I wish I were able to participate directly but that will have to be reserved for my next lifetime.

The International Dinner at the Holloway House seemed to be a success... Definitely a noisy gathering... Everyone with stories to tell of conferences and people gone buy as well as tales of latest projects that they find interesting. An appropriate setting on the day of the new museum dedication since Bruce Kelley and the other board members, way back when, gathered at the Holloway to plan the museum for the Academy building.

Wednesday was a good Book Fair, a full day of programming wrapped up with pizza and a really accomplished pop string band.

I was out in the flea market Thursday morning at 5:30 AM Beautiful weather but not much going on . A really slow start Along about 9:30 AM I counted 50 or so folks with something to sell In the next hour that number bumped up to maybe 60+. There was a fair variety of stuff with the usual "problem" that the good stuff was crazy expensive for a guy like me. The layout of the market is a little bit different bringing the entrance to the market a little closer to the building. Setup was first come first choice on parking and only a single charge for flea market space regardless of how much stuff you brought. Still a number of folks were set up along the far back area from the hotel.

The contest was just great. I think Geoff Bourne said that there were 84 entries. There was actually a space problem. The hotel has done some remodeling of the meeting rooms moving the dividers I think. So hopefully we will have an additional area for display next year. More Heathkit (the theme) than I expected including Tom Peterson's near mythical O-1 (Heathkit's first offering to the public ☐ an O-scope using mostly war surplus parts.) Best of Show went to the scope. Dave & Julia Bart ☐ Ralph Williams Display award for "Lincoln's Telegraphers" -- There went my chance :<(. I did get the Elle Craftsman award for my glass cased Quadraformer. Merrill Bancroft received the Houck Award for preservation. There was no award for documentation.

Joe Knight can report better on tube activities . I don't think there was a Tyne Award this year . If not, there certainly should be a roll-over of any late nominations into next year. A young guy had my hopes up for a Shickerling SX-4000 but turned out that it was another Shickerling tube ☐ more scarce but just not one I need to complete my glass set.

There were about 350 lots in the auction, good assortment of European tubes, a great Paragon tuner with pre-selector and 3 tube detector amp went for a relative bargain ($1,600) And a mint+ Northern Electric R4 with the factory built-in power amplifier stage that went for only $700.

On the AWA website there are event pictures already posted . I noticed that my Opera browser for my tablet could not access the tabs to bring up the photos Maybe it only works with `Winders'

That's about it I missed the Key & Telegraph segment just out of exhaustion . At almost five days, there is no other conference like it that I am aware of And that is why I hope to make the 1,500 mile round trip next year for the 41'st time in 42 years.

Robert

didn't this post already!?

In a message dated 8/26/2013 5:45:25 P.M. Mountain Standard Time,
tubelore@... writes:

Does anybody have use for a Callbook or several Callbooks? The following
are available here:
1938 Summer (Vol. 19 #2), worldwide, cover replaced with new white card
stock, binding tight
1954 Winter (Vol. 32 #4), worldwide, cover slightly chewed up and reglued,
has gotten wet so pages are crinkly
1982 (Vol. 60 #1), foreign listings, tight binding, front cover lightly
discolored
1983 US listings (Vol. 61 #1), tight binding, cover lightly discolored
1983 US listings (Vol. 61 #1), tight binding, cover moderately discolored
(second copy of above)
1984-85 US listings (ARRL production), binding fairly tight, cover has a
couple of corners missing
These are clean and non-moldy. They were given to me, so you can have
them for the cost of postage (they “contain advertising” so don’t qualify for
Media Mail). “Take them all” responses are preferred, but I could part
them out. Pse email me directly (_tubelore@..._
(mailto:tubelore@...)) rather than occupying the reflector.

12406. Tek 585A

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2013-08-29 19:05:34 UTC
From: Leonard Meek
Topic: 12406 Message: 12406

Anyone have any experience with a Tek 585A scope? I mean other than scrapping it. Mine died a few weeks ago and I just got around to looking into it yesterday. I found a badly charred cap in the B sweep trigger circuit that doesn't seem to be on the schematic. In fact, it doesn't look like the caps that Tek usually uses, and is installed in a manner unlike a Tek installation. It appears to be bypassing the 350V to the cathode follower and is not a 'lytic cap. The scope seems to run alright without it, but I won't know untill I go through the realignment. This is my favorite scope. It has survived replacing the high volt rectifiers, twice (the leads corroded off) and one 2000V cap shorted. A couple of other tubes were replaced and the tunnel diode contacts were burnished, but aside from that it has been a faithful workhorse.

Leonard

12407. Spark Gap Collections

From: w6adv
Topic: 12407 Message: 12407

For those are interested in spark transmitters, and receivers, and keys you are encouraged to visit the Spark Gap Collectors group at Yahoo.

Lots of great photos of collections you won't find elsewhere.

Here are the details on SparkGapCollectors:

Group home page: http://groups.yahoo.com/group/SparkGapCollectors
Group email address: SparkGapCollectors@yahoogroups.com

I would encourge collectors and historians to share your own photo collections and help establish a forum for the exchange of information, and help with identifing those unmarked items.

Thanks,

Craig

Antique Wireless AssociationTom, thanks for the link. If I have any more trouble with it, I'll contact him. For now the scope seems to be working fine. The cap in question was apparently a field change, legitimate or not, but it was burned so that the value couldn't be read. I can only assume (bad word) that it was a decoupler because it didn't serve any other purpose where it was located.

I stopped by Robert Garcia's table and picked up a business card at the Shelby Hamfest this past weekend. If the older gent I spoke with was Robert (he was very 'scope knowledgeable--so I believe it was him), his eyes are giving him increasing difficulty due to age. There were severeal scopes at his table that by his own admission, he could not see well enough to repair anymore--mostly Tek 465s. A very nice man and knew his stuff!

If you have some possible work for him, you may want to contact him soon.

I'm in the same boat as Robert Garcia. I have cataracs and macular degeneration in both eyes and am no longer able to leap over tall buildings, at least not in a single bound. My scope is working for now. It pained me to think of retiring it. Giving it away would have been an option, but I don't know anyone (within a 1000 mile radius) who's into old DIY stuff any more. Smithsonian keeps bugging me to subscribe to their magazine, but I suspect they'd really like to put me on display in one of their dinasaur exhibits.

Tek 585A
Thu Aug 29, 2013 12:05 pm (PDT) . Posted by:
"Leonard Meek" leonardmeek
Anyone have any experience with a Tek 585A scope? I mean other than scrapping it. Mine died a few weeks ago and I just got around to looking into it yesterday. I found a badly charred cap in the B sweep trigger circuit that doesn't seem to be on the schematic. In fact, it doesn't look like the caps that Tek usually uses, and is installed in a manner unlike a Tek installation. It appears to be bypassing the 350V to the cathode follower and is not a 'lytic cap. The scope seems to run alright without it, but I won't know untill I go through the realignment. This is my favorite scope. It has survived replacing the high volt rectifiers, twice (the leads corroded off) and one 2000V cap shorted. A couple of other tubes were replaced and the tunnel diode contacts were burnished, but aside from that it has been a faithful workhorse.

There are apparently cheaply made electrical extension cords out there that can overheat & melt, if not unrolled from their spools. Read the attached safety message for details.

40+ years ago an electronics instructor cautioned us to uncoil ac power cords prior to use to prevent transformer action and the issue that is described here.

12417. August 1930 Wireless World article query....

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2013-09-09 16:39:34 UTC
From: <kd4hsh@...>
Topic: 12417 Message: 12417

Sitting in a closet for about 30 years is a 1929/30 vintage McMichaels 'Screened Dimic III' originally acquired by Paul Giganti in 1954 when he paid $35 for it. (From notes sent to John Caperton in 1968) I bought it from John back in the days of Canandaigua AWA Conferences. Interesting in that it has a boxed set of all (?) coils - 15 to 2,000 meters.

It is complete except that the top lid of the cabinet is missing. In the papers there is a bad Xerox of a write-up in some August issue of Wireless World. Must be either August 1929 or 1930. What I need is the best view possible of what the top looks like. I have an advert from the T&R Bulletin for May 1930...

Just trying to get the best guess possible on how the top lid is made.

Robert

That is one variation on the cabinet, yes. It still does not give me enough info to make a real replica.

I've got to hope I get real photos. The UK Vintage radio forum has a 6 year old thread on the Dimic 3, I hope I get a response to a query made there.... There were comments that there were three known to the collectors... If I get nothing, I will try starting a new thread.

12435. RE: cleaning the brown off of a black panel

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2013-09-18 12:37:50 UTC
From: <kd4hsh@...>
Topic: 12434 Message: 12435

Ron,

That panel is hard rubber. There is a distinctive odor to hard rubber compared to cleaning Bakelite.

The unhappy news is that the material oxidizes over time. The rate has a lot to do with the average humidity and polutants in the air. If you are lucky the oxidation has not penetrated too far and you can buff it out. However I have cracked scraps of hard rubber and seen oxidation going down 0.020". The problem with that is that this can be deeper than engraving. By the time you buff down to a black panel, the engraving will be gone.

I have not found any stain that will penetrate the brown surface to a significant degree without yielding a really bogus looking purple cast.

To polish what you have, use Go-Jo & XXX grade steel wool... It is slow cutting enough to give you precise control of keeping the coloration consistent over the panel.. Buff for a couple of minutes, do a wipe-down and examine then repeat as necessary.

After you have finished, Make a little smooth pad of old bed sheeting and apply a small amount of Kiwi black shoe polish to a SCRAP piece of panel material. This 'charges' the pad with the polish. Then use the charged pad to go over your hard rubber panel.... It is worth the effort.

How do I know? I did that exact process to my 1928 McMichaels "Dimic 3" last week. Did I get to black? No... The oxidation is just too deep.

Robert

--- In antiquewirelessassociation@yahoogroups.com,
<antiquewirelessassociation@yahoogroups.com> wrote:

I wonder if anyone has any suggestions to help me clean the
panel of an english crystal set.
The panel is a kind of muddy brown color, like coffee with cream
in it.
When I removed the tuning knob I found a shiny black panel underneath.
I've tried to clean it using Go-Jo and even used a scotch bright pad
to try and scrub it clean. Nothing helped, I turned a lot of paper towels
brown but the color on the panel didn't change.
Is there anything that will reverse this discoloration?
Or should I just give up and wax what's there and live with it?

OK Neat Ron! did you used to use them in the service?
I tend to influence the collection here for the museum that I worked
on.
at our transmitter site we had GRC-27 and GRT-3 Transmitters
I have the GRC-27 Receiver but I need the transmitter! and an AM-447
line amp.

the only mobile rig we worked on was a GRA-53 a horrid to work on
pencil tube thing for UHF... Like the GRC-27 driver section, the GRA-53
had bend-em tabs to align it... BUT the GRA-53 ones would break
off internally much easier

I pulled a stint at the Mars station after a car accident (I was a
passenger) and actually ended up
being the NCOIC of it for awhile so I am also trying to get a Collins
KWM-2a now tat I am licensed (KF7RWW)

Topic: 12453 Message: 12453

I decided to sell my IP-501A. It is an early one. I picked it up from an old seagoing radio operator's estate. It is clean and undisturbed. It was sitting in his attic, probably from the 1950's when he went into supervision at a refinery. It has been in my living room since I bought it about 8-10 years ago.

It does need some light cleaning and there is a small light tar-like mark on one of the silver dials. All screws, knurled nuts, and the buzzer cover are there, undisturbed and unrestored.

I'm asking $3200 which I believe is fair to low for this set.

Please contact me directly..... oldradio@...

Folks,

We still need volunteers to help inventory and pack the late Ted Bryans vintage radio and audio equipment for transport to storage until auction at Antique Radio Charlotte next March.

We think that Saturday - October 26th. getting there at 8 AM would be the current plan. If we can get 7 folks, the task can be done in 5 to 8 hours.if folks don't get into gab sessions not actually working ;<)

There are a lot of parts to pack into box lots, fill out auction sheets and make sure items are photographed for posting on the conference website.

Your work will help a family living far out of state and make for a great auction opportunity for us here in Charlotte next March.

http://radioheaven.homestead.com/The_Treatment.html

These photos show how it looked before started "The Treatment"
and after.
Below the ACE 3B are photos of the Radiola Super VIII I brought
home from the auction and it's before and after cleaning photos.
I've been wanting one of these for more than 30 years but I never
could find one I could afford. I could afford this one,
it was FREE. The man that owned the mini warehouse gave it to me :)

Both of these radios are just the way I like to find them.

Cheers.

12484. "Patrolling the Ether" on TCM, tomorrow 27 Oct

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2013-10-26 13:49:12 UTC
From: N2MHO
Topic: 12484 Message: 12484

Hello all,

For fans of the (MGM?) short "Patrolling the Ether," about FCC enforcement in the 40s, it is scheduled to run Sunday morning 0935 - 1000 EDT.

Mike, n2mho in SNJ

12485. Re: [AWA] "Patrolling the Ether" on TCM, tomorrow 27 Oct

12486. "War of the Worlds" weekend on BBC

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2013-10-26 14:23:02 UTC
From: N2MHO
Topic: 12486 Message: 12486

This afternoon (EDT) on BBC Radio 4, "Archive on 4" will look at the background of Orson Welles' 1938 Mercury Theatre presentation of "The War of the Worlds," 75 years ago this month, 2000 hrs UK time (UT+1, I think):

http://www.bbc.co.uk/programmes/b03f86lh

Tomorrow a replay of the actual program is scheduled for 1800 hrs UK time (= UT?) on Radio 4Extra:

http://www.bbc.co.uk/programmes/b0088ypf

I think the time scalings are correct, pls let us know if they're not.

73, Mike, n2mho in SNJ

Cooper Hewitt Mercury Arc Valve Vapor Tube

I have recently acquired an excellent condition Cooper Hewitt mercury vapor tube and am trying to find some information about it. I have found a bit of information about these tubes but have not seen any information on this particular tube yet. I have attached a picture for reference. More detailed pictures can be made available if needed.

Any information is appreciated.

This is one of the smaller (!) ones. General Electric was the major source, although there were others, Philips among them. They were used, beginning ca. 1905, for powering arc street lights, large battery chargers, larger DC supplies in telephone systems, electroplating supplies - places where a motor-generator was unsuitable. I've seen a photo of a huge one of these, maybe a foot in diameter, retired from an electrified railroad in Argentina.

This is the unit that had to be tilted mechanically to start the arc, either by the user pulling a cord or by an automatic solenoid arrangement. Impressive blue glow in operation.

These guys also appeared in a few high-powered amateur transmitters, as written up in "QST" in the mid-'20s.. Someone exhibited a re-creation of such a rig at Rochester a few years ago.

The really sexy ones are the versions with four or six arms, for rectifying two- or three-phase power.

The "Cooper" is the namesake of the Cooper Union in New York.

There's stuff On Da Web on these - GE instruction books and the like.

Please don't break it . . .

Don't forget, the Fall Swap Meet at Greensboro/Jamestown is TOMORROW MORNING! ! !
It's in City Lake Park in Jamestown, you can find full details on the Fall Swap Meet web page at; http://www.cc-awa.org/Fall.html

Look forward to seeing you there.

Don't forget, the park management told us that they won't be unlocking the gates until 8am so there's no need to get there early.

12507. Ultrasonic cleaner performance comparison.

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2013-11-03 01:17:50 UTC
From: <kd4hsh@...>
Topic: 12507 Message: 12507

In the late Ted Bryan's shop tools is a virtually new China made ultrasonic cleaner. I had seen these come on the market about two years ago at a place called WT Tool.

http://www.wttool.com/index/page/category/category_id/21262/
http://www.wttool.com/index/page/category/category_id/21262/

They have them in two sizes and Ted went for the larger model. ($329)

I have an Electrowave model EW-3 that is more than 15 years old. (They still make them… $350 with heater.)

http://electrowavecorp.com/ew-bench-top-ultrasonic-cleaners/
http://electrowavecorp.com/ew-bench-top-ultrasonic-cleaners/

I thought it would be a good opportunity to compare the performance of the two.

The tanks of the two units have different height/width/length ratios with the China unit having a little more than 30% more volume. (Ted thought he might want the extra tank length for big ganged tuning condensers. – The longest thing I've ever put in my tank is the frame of a Philco 90 tuning condenser.)

In my normal cleaning process I put clean water in the tank and then suspend 250 ml Pyrex beakers with various cleaning agents in them.

It only took a minute or so to see that the 15 year old Electrowave significantly outperformed the new China made unit.

Both units have built-in heaters but I almost never use the heater in mine. When I do want heat; in the shop I have a little microwave oven where I can zap a quart or so of water to temp much faster than the tank heater.

A couple of years ago I was at the Manassas Hamfest and almost bought a Branson ultrasonic cleaner that had a tank of about 1 gallon capacity. Fortunately the seller was willing to let me take it to a bathroom where I could fill and run it. I was not at all impressed with its excitation and in retrospect its performance seemed to be similar to the China made tank I tested today….

So, in my book the US made Electrowave cleaner is significantly better and not all that much more expensive.

Ted's cleaner will be in the auction next March…. If you can get it for half price, you might be happy enough with the results.

Robert

12509. Cigarette grime, goo & stink

Alan,
Concentrated Ammonia does a wonderful job of getting rid of Nicotine. There are some things that it won't remove (dirt wise), so I use a mixture of 80% concentrated Ammonia and 20% 409. This works GREAT for cleaning up equipment!

12517. Announcing the AWA Bruce Kelley 1929 QSO Party

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2013-11-14 03:41:42 UTC
From: whitebear1122@...
Topic: 12517 Message: 12517

It's time to dust off those 1929 transmitters and get them chirping again. A PDF of the log sheet is up on the AWA webpage. I will have them put a WORD version up there so you can do electronic entry and email it to me. I will acknowledge that there is a small group of die hards who use their 1929 gear all year long so they don't have to dust anything off. hi hi

The 2013 Bruce Kelley 1929 QSO Party

The Bruce Kelly 1929 QSO Party is a yearly AWA sponsored event where participants build their own transmitters using the designs, techniques, and tubes that were available in 1929 and earlier, and then put those classic transmitters on the air and try to contact as many other 1929 stations as possible. Since they use early designs, it is a cacophony of whooping, chirping, buzzing, clicking, drifting, swishing, swaying, warbling, and other interesting signals. This is what ham radio sounded like in 1929 and for two weekends in December it’s 1929 again on the ham bands. Last year sixty seven brave stations ventured down into the hinterlands of 1929! The 1929 QSO Party was started in the early 1990’s and championed for many years by Bruce Kelly W2ICE, an AWA co-founder. Prior to Bruce’s passing, he asked his close friend John Rollins W1FPZ to keep the 29 QSO Party going. John Rollins managed the QSO party for many years and renamed it the Bruce Kelly 1929 QSO Party in honor of Bruce. Nine years ago John Rollins asked me to manage the 29 QSO Party for him and Bruce, and to keep the evening alive because it meant so much to both of them.

Dates and Times: First two weekends of December, Saturday Dec 7 through Sunday Dec 8, and Saturday Dec 14 through Sunday Dec 15. Starts at 2300Z (6:00 PM EST) Saturday night and finishes at 2300Z (6:00 PM EST) Sunday night, both weekends.

Objective: Contact as many 1929 stations as possible. Contact exchange consists of RST, Name, QTH (State such as ME or MN or NY), last two digits of the year of the transmitters design or publication (such as 29 or 27 or 23), type of transmitter (such as TNT or TGTP or MOPA or COLPITTS), and power input (such as 6W or 9W).

Rules: Transmitters must be 1929 or earlier types of self oscillators such as the Hartley, TNT , PP tuned grid tuned plate, MOPA, Colpitts, etc. No crystal oscillators. Tubes must have been available during or before 1929. Typical tubes often used are type 10, 45, 27, 211, 71A. Individual stations can be worked only once on each band over the course of two weekends. You can use any vintage or modern receiver that you wish. The event is open to all 1929 stations including non-AWA members and AWA members. You are encouraged to join the AWA and support 1929 radio!

Input Power: Transmitters are limited to a power INPUT of 10 watts or less. However, to help make East-West contacts, power may be increased to 20 watts INPUT between the hours of 0500Z (12 Midnight EST) and 1300Z (8 AM EST). Note this is INPUT power. Power input is calculated by multiplying PA plate voltage x total PA plate current. Example: my plate voltage is 300 volts dc, and plate current is 30 ma, so total input power is 300 x 0.030 = 9 watts input.

Frequencies: The QSO Party typically operates between 1800 to 1810 Kcs, 3550 to 3580 Kcs , 7100 to 7125 Kcs, plus or minus depending on QRM. Last year 12 brave souls ventured down

into the ‘hinterlands’ of 160 meters for the first time. 40 meter activity is up significantly because of it has both night time AND daytime propagation! So when 80 shuts down Sunday morning, I hope to see you on 40m.

Logs: Please submit your log so we can see who you worked and acknowledge your effort! Either electronically email your log to Scott at wa9wfa@... or mail via post office to: Scott Freeberg WA9WFA, 327 Wildwood Avenue, Saint Paul, MN 55110. Logs must be in the 1929 QSO Party log format otherwise it will be difficult to score you. An official 1929 log sheet will be available for download from the AWA website. Please do not email logs to any other email address except to the WA9WFA account. Because of email problems in the past, I will acknowledge receipt of all email logs. If you do not receive an acknowledgement within a couple weeks, better check with me to make sure I received it.

Scoring: Remember that contacts with modern stations DO NOT COUNT. Only count legitimate 1929 contacts. If you are contacted by a modern station, be polite, mention the AWA QSO Party and point them to the webpage for more information, then move on, or QSO them if you wish. Often QSO Party participants will spare a moment to make a brief modern QSO and 73. We will count contacts with W2AN, the AWA club station. Scoring is simple. Add up the number of legitimate 1929 QSO’s. Example: if you make 15 QSO’s on 80 meters,10 QSO’s on 40 meters, and 5 QSO’s on 160 meters, your final score is 30. All submitted logs will be scored and the results published in the AWA Journal. Please submit logs by January 15, 2014.

Good luck to all participants and please send me a photo of your 1929 station. Thanks. 73, Scott WA9WFA

The AWA Museum is looking for one, too!! The AWA Museum has a M31 that came from the Teletype Corp. Museum when it was shut down.

Jim Haynes just told Ed Sharp & I of an article about the M31 in "Tele-Tech" magazine, Feb, 1947 (on line at americanradiohistory.com). The article is the first place I have seen anything about the control unit/AFSK converter used with the M31. (The pictures below came form the article.)

The M31, aka TT-30/AGA-1 was designed for the military as a mobile TTY for use with RTTY in vehicles and aircraft. It operates on 24VDC and had a dynamotor to provide 250VDC for the converter and loop supply. It also has a 26L6GT for motor speed control. When you start typing, a separate contact is closed to turn on the transmitter. It was used in President Truman's plane and may have been specifically designed for that installation.

Teletype Corp. apparently didn't sell many to the military, so they put a synchronous motor in it, and a handle on the cover, and sold M31s for use by sports announcers to carry with them to the games.

Any information on the M31 or AN/AGA-1 would be appreciated.

The Americanradiohistory.com web site has a lot of scanned magazines covering radio & TV history.

Have fun,

Duncan - we have our eyes out for a case for yours. your military model needs the proper holes in it for the lights etc that are unique to that military model.

Question is though re: photo in this article....was this control/AFSK unit issued to the military or just offered as a commercial item? If military there should be a manual we can get hold of that will provide a wealth of knowledge.

In the article it is clearly the commercial version of the Model 31 being shown...

another thing notice they mention this being a 20 mil loop on the commercial one... glad to learn that before I lit mine off... Our commercial one belonged orig to John Sheets then George Hutchinson then us.

One thing of note... there was a large offering of these machines to HAMs... but since they were tape printers did not get as much love as the page printers... like the model 15 the good thing? these things are small enough they my be lodged under workbenches and in out of the way places still

at SMECC we are trying to figure out how many of these are still around so If you have one or know of some one lets get a count..... drop note to _info@..._ (mailto:info@...)

this is one of the portable Teletype Model 31 units in Western Union
portable case.
(before we cleaned it up.)

See the partial circle black type wheel thing above the paper tape in the
printing position?
we need one of those type wheels as this one has a chunk missing.

also always looking for the rolls of gummed printing tape for these units!

do you have one? what is the S/N# we are tying to get an idea as to how
many were produced....

Ed,

The picture in the Tele-Tech article may have been a mock-up just for the magazine article, as it was written many months before the M31 manual (Bul. 200) came out and a couple years before M31 production started.

According to the Teletype Corp. Museum books, there were 500 M31s produced, between 1949 & 1959. There may have been very few of the AFSK converters made. The AN/AGA-1 spec sheet (http://www.virhistory.com/navy/rtty-tu.htm) I sent you does not list a manual number for the TT-31/AGA-1 (the AFSK converter). The manual listed for the TT-30/AGA-1 (the M31 printer) is listed as "80MA" which just the Teletype Corp. Bulletin 200, M31 manual with a one sheet cover page.

Most military RTTY used a 20 ma loop. The 60 ma loop was a left over from the telegraph days and when a telegraph or "printing telegraph" had to drive many miles of wire. Most Teletype Corp. M14, 15, & 19 machines would only run on 60ma, so hams were required to stay with the old 60 ma standard. If you have a TTY only a few feet from the radio, a 20ma loop is sufficient & doesn't require as much power.

have fun,

Duncan

ok I am going to have to learn more about this.... Ed#

In a message dated 11/14/2013 2:03:33 P.M. US Mountain Standard Time,
jhhaynes@... writes:

Note that the original Model 14 and Model 15 equipment with pulling
magnet selector has the selector coils in series for 60MA operation;
20MA is not an option. Model 14, 15 and later equipment with the
holding magnet selector allows the coils to be in series for 20MA or
in parallel for 60MA. I've seen military Model 15s with a decal on
the copyholder saying they have been refitted with different magnets
that can go either series or parallel, and the picture on the decal
shows the cylindrical magnet coils that belong to the pulling magnet
selector. But I've never encountered a machine that actually has the
special coils, in spite of the decal.

The original purpose of the holding magnet selector was to allow the
voltage on the cord circuit of the TWX manual switchboard to be limited
to 48V. Otherwise they had 120V, which could be deadly and definitely
shocking. This I heard from the late Walt Zenner who invented the
holding magnet selector, so I take it to be truthful; but I've never seen
this mentioned in any of the literature about the selectors.

I read somewhere that the Bell System went to 20MA operation just to
save electricity in situations where the TTY machine is not very far
from the telephone office. An office with lots of TTY loops consumes a
lot of power just keeping them all turned on all the time. 7.2 watts
per loop, versus 2.6 watts for 20 MA loops.

I don't know that the use of 60MA in ham installations was so much of a
conscious choice as it was a matter of accomodating whatever equipment
might come along, including Model 15s with pulling magnet selectors.

12528. The Teletype Museum & the AWA Museum (was Model 31 Teletype)

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2013-11-15 16:28:16 UTC
From: Duncan Brown
Topic: 12518 Message: 12528
Attachments: 1 described; binary payloads are missing from this source WARC

The Teletype Corp. once had a large (~700 pieces) collection of prototypes, early models and competitor's products in their R&D building. But as often happens in industry, floor space is valuable and most of the collection had to be boxed up and put into storage. In the late 1970's, what was left of their museum was also boxed up and put into storage. By the mid 1980's, the storage area was also needed and it was decided to get rid of the main collection. (A few of Teletype's "winners": Models 15, 28, 33, & 40 were saved.)

Teletype Corp. contacted the Smithsonian Museum, thinking that they would like the collection. Smithsonian said that they had most of what they needed, but gave Teletype Corp. the names of other "major" museums, including the AWA Museum, that might be interested in the collection artifacts.

Before the Teletype Museum collection had been boxed up, the curator of the Museum, Ran Slayton, had cataloged the complete collection with a photograph and description of each item. These were bound into twelve 9 x17" books and are known as the Teletype Museum Books. When the collection was to be dispersed in the mid 1980s, copies of these books were sent out to all the Museums that had expressed interest in taking parts of the collection, for them to choose what they wanted.

When we unpacked the old AWA Annex library and were setting up the new AWA library in the AWA Media Building, the AWA's copies of the Teletype Corp. Museum Books showed up!! (This may be the only set still in existence.)

I have had our Museum books scanned (thanks, K4OZY), but many of the photos came out poorly (too dark). If the image is lightened, then you cannot read the text. One of my spare-time projects is to go through and selectively lighten just the pictures. Once that is done, the books will be put on line. (Hope I can get to it this winter!) Enclosed is a scan of a page of the M31 tape printer that we have been discussing (that photo is pretty good). Although it says it went to the "Chicago Museum of Science and Industry", this looks like the M31 that we have in the AWA Museum (with 26L6GT & dynamotor).

The donation to AWA of this equipment happened long before I was a member of AWA, but I came across some of the artifacts while digging around in the old Annex when I first started working at the Museum in 2000. I don't know of any literature that was donated (other than the Museum Books). Items that I have identified as coming from the Teletype Corp. Museum that are now in the AWA collection:
Teletype Corp.

M31 (aka TT-30/AGA-1) tape printer; c 1947
GPE (aka "iron horse") perforator; c 1930
M36 (aka "monopulse") keyboard & tape printer; c 1940
T-61 encryption unit (similar to SIGCUM but with a tape reader); c WWII
various Morse (aka Wheatstone, Kline) tape readers & possibly tape punches

Kleinschmidt Electric Co.
Model 20A tape printer; c 1920
(this printer uses the now standard 5-bit code, but in _parallel_. There is no motor. Instead, there are five solenoids that read and store the data, and then another solenoid that initiates the print function. The early 1900s teleprinters all operated in parallel with individual address lines. This is why the M14 tape readers had a big "distributor" and were know as "transmitter-distributors" or "TDs". The tape holes (bits) were read in parallel and the distributor did the parallel to serial conversion. Today's computer architecture still uses this system of a parallel data bus and a "chip select" line to tell which device should read the data on the bus at that time.)

The Teletype Corp. M31 & GPE and the KEC M20A are now on display in the new AWA Museum.

I can't tell you why there was not an AWA OTB/Journal article about the donation from Teletype Corp. back in the 1980s, but this email will have to suffice!

Have fun,

Hello Everyone,

I'm looking for information on a 1937 Canadian Marconi Educational Transmitter. Is there a Marconi archive around that is maintained? Any information is appreciated. I posted a picture on my QRZ page.

I would love to read about my ol' FRXD-3-EL "climbing monkey" non-typing reperf.

I donated mine to the Science Museum of Long Island, and the director tossed it out!

Sure would like to have another.

The seller is talking about a value of $300,000 to 400,000. Its a long ways from even 100,000. There are very few rare sets and the 5 tubes in a common 3 dial set are often worth more than the set, if tested good. However, i see no details on the condition of the tubes, which would take some time to test.

Tell me about Howard's house.

I remember Rockola president's Glenn Streeter's garage in Palos Verdes Estates back in the late 70s when he was president of the Southern California Antique Radio Society.

As far as California collections... go... The museum project bought most of the Glen Streeter stash in the late 70's yea the garage was a wonder! We also bought Morgan McMahons collection, garage, and research library in the 80s also got some great stuff from Joe Horvath and Woody Wilson... and... then...also 3 other wireless collections that shall remain nameless..

I grew up in the PV area I miss the Ocean! Going over to see Glenn and Morgan was always great!

Well... Howard's house had all house full all attic full garage full... you would open kitchen cabinets and there audio transformers in there... We bought just a few things for Howard but one nice prize was an RCA Condenser black box mic on announce stand with elaborate NBC plackards on all sides ..

I will get the photos here somewhere...of visit with howard.

ah the old days...
I would not even think twice about jumping in my big chevy van and hitting the road, and if it was a lot my fields at allied van lines would just bring a 40 or so foot truck.....

Now I really even hate driving much! age eh?

12558. RE: [AWA] Collection of over 1100 radios is for sale

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2013-11-29 17:47:58 UTC
From: Craig Pitcher
Topic: 12540 Message: 12558

One of the most enjoyable parts of building up a nice collection, is having an opportunity to show it to people who appreciate our stuff.

Unfortunately, there isn't a directory of private collectors who you might contact when you are visiting an area. I for one, would love to see some private collections, and would throw open my doors to a fellow collector visiting silicon valley.

Perhaps it would be worthwhile to create a regional list of collectors who would be willing to let fellow collectors visit their homes (with reasonable notice) to view their collections. The list would not have specific addresses, but organized by region, and have the name, phone number, and reference to what they collect. To make the list more valuable, we could also include the many regional club sponsored museums in those areas.

Thoughts?

Lud - Howard Hein was an eccentric bachelor who lived in San Carlos. i was introduced to him by Paul Giganti, who was one of his friends.

He had stacks of movie posters and other stuff besides radios which filled the house, even one of the bathrooms. He had a double-decker Leutz, don't know who got that.

You had to listen to his stories before you could buy anything.

Unfortunately Howard would allow people to wander though
everything...
It was sad to hear of people stealing from him.

In a message dated 11/29/2013 11:45:54 A.M. US Mountain Standard Tim,

Lud - Howard Hein was an eccentric bachelor who lived in San Carlos. i
was introduced to him by Paul Giganti, who was one of his friends.

He had stacks of movie posters and other stuff besides radios which filled
the house, even one of the bathrooms. He had a double-decker Leutz, don't
know who got that.

You had to listen to his stories before you could buy anything.

An added note. there was no such thing as a short visit to Howard's
House!

In a message dated 11/29/2013 1:37:05 A.M. Mountain Standard Time,
COURYHOUSE@... writes:

As far as California collections... go... The museum project bought most
of the Glen Streeter stash in the late 70's yea the garage was a
wonder! We also bought Morgan McMahons collection, garage, and research
library in the 80s also got some great stuff from Joe Horvath and Woody
Wilson... and... then...also 3 other wireless collections that shall
remain nameless..

I grew up in the PV area I miss the Ocean! Going over to see Glenn
and Morgan was always great!

Well... Howard's house had all house full all attic full garage
full... you would open kitchen cabinets and there audio transformers in
there... We bought just a few things for Howard but one nice prize was an
RCA Condenser black box mic on announce stand with elaborate NBC
plackards on all sides ..

I will get the photos here somewhere...of visit with howard.

ah the old days...

I would not even think twice about jumping in my big chevy van and
hitting the road, and if it was a lot my fields at allied van lines would
just bring a 40 or so foot truck.........

Now I really even hate driving much! age eh?

OK, we've got a lot of eccentrics in this line of work. Present company excepted, of course!

I used to be the "All-American Kid from Redwood City," but hadn't heard of him.

Ed - some of Glen's good sets came from me. After i bought the W4AA collection about 1976, i wanted to sell off the duplicates quickly and called Glen. He flew back to NE, rented a truck, and came to my farm. I wanted to get $10,000 to pay the bank, and we had picked out 8,000 worth of sets.

I then pointed at the Marconi 101, and said how about $1000, and the same for the deForest Trunk set. he was happy to oblige.

A 101 sold at the Dearborn auction later for $49,000!

Live and learn. He also got a deForest RJ-6 later in a trade from me. i sent a story about this and more to ARC, but it never got published.

interesting to know more on the history of some of this gear!

When you refer to the 101 do you mean the magnetic detector!? Paul gigani had some for sale at the late 70s also and they were nowhere near 49k
I almost think it was $1300

No, the 101 is a Marconi receiver. Paul had 3 Marconi magnetic detectors one of the many times I visited him. One downstairs and two in the attic. One time Paul did take me to Rasmussen's house and another time to Floyd Lyons' place. – Mike

Hi Will,

Here's a pic of the Marconi 101 you used to own, it has been sitting
in my living room since 1995.

http://i1372.photobucket.com/albums/ag334/marconiman/Marconi101_zps5a4ad7ea.jpg

Glen Streeter sold it to Ralph Muchow, who then traded it on until I
ended up with it....

The 101 at the Dearborn sale had a lot of mods including removing the
detectors & extra holes.

It sure is a real big Crystal Set.... This was installed on the
USS Virginia in 1914....

Hope you and the family had a nice thanksgiving!

Hi Jim,

Real nice piece Jimbo. The best radio in my Living room is my IP-501-A.

Attached is my ham shack photo.

Did you see my Massie Coherer in QST? Here's a link to my Massie web page:

http://www.eht.com/oldradio/arrl/2013-12/Massie%20Coherer%20K2TQN%20December%202013.html

73, John Dilks, K2TQN

Hi Will,

Here's a pic of the Marconi 101 you used to own, it has been sitting in my living room since 1995.

http://i1372.photobucket.com/albums/ag334/marconiman/Marconi101_zps5a4ad7ea.jpg

Glen Streeter sold it to Ralph Muchow, who then traded it on until I ended up with it....

The 101 at the Dearborn sale had a lot of mods including removing the detectors & extra holes.

It sure is a real big Crystal Set.... This was installed on the USS Virginia in 1914....

Hope you and the family had a nice thanksgiving!

Jim –

As I recall, you also picked up a 101 when we had the meet that you hosted at Buffalo sometime in the 80's. Even Paul was there. 73 – Mike

Hi Mike & John,

Long time no see Mike- we gotta get together again one of these
days, nice to hear from you!

Back in 1985 Paul Giganti brought over a Cohen Type A receiver and Thorn
Mayes' Maggie that came from
Cape Race- it was the one used when it was in contact with the Titanic.
I have it on display in Branson, Mo..

You are probably thinking of my first Marconi Multiple tuner, I had just
got it from the UK & showed it to you & Paul-
it needed a lot of restoration, but was all original & complete.

John, Thanks for the nice comment- been pretty busy lately with the AWA
Museum & 4 Grandkids....
I would like a Massie coherer- got any extras??

Hope everybody on the list had a nice Thanksgiving!

12578. Tektronix Model 511 O-scope - their first

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2013-12-04 20:21:45 UTC
From: <kd4hsh@...>
Topic: 12578 Message: 12578

Folks,

A friend has a Tektronix model 511 oscilloscope from 1947. The serial number is 146 and Tek history says the first SN was 101. They told him this is the first product for the company although I found an indirect reference that says there was a model 501 built in 1946 but apparently not advertised. It definitely was a tech inovation with its delay line for triggered sweep and calibrated time base.

In any case he is wanting to know what collector value it might have... I told him that in most cases vintage test equipment is regarded as the Rodney Dangerfield of electronic history. The hottest items maybe being a Tektronix 570 tube curve tracer and premium tube testers...

Any comments welcome...

Robert

From: Bill Stewart
Topic: 12580 Message: 12580

This sad news was posted on the ARC-5 list. Sure hope someone can keep this great source of vintage/antique parts going....Bill K4JYS

"Playthings of the Past is up for sale. The owner, Gary Schneider, wants to retire. He posted the notice to his web site on November 29 .

Someone who has about 8000-plus square feet of storage space could take over the business.

Gary has one of the largest inventories of vintage parts that I know of.

No idea when he will stop accepting orders; but my advice would be to grab 'n growl while the gittin's good.

73

Mike

Topic: 12582 Message: 12582

Hello All,

My radio club (Ole Virginia Hams) came across several items that they want to sell. I told the club that I would post them on the AWA reflector to see if anyone is interested. We have not set any prices yet. Pictures can be available for the asking.

If you are interested, please contact me directly at: WA2GTT@ ARRL.Net or give me a call at the number below. You will probably have to leave a message and I'll call you back. >>> No calls after 8pm, please.

BC-314-F receiver. 150 - 1500 Kilocycles. Cira 1941. >>>> Exterior is in pretty good condition, just a little dirty. Tuning knob and band switch operate smoothly just like they should. Knobs are just fine. Working condition unknown. Switch labels etc are good. Weight of the radio is just fine too!

Heathkit Model O-6 Oscilloscope. Good physical condition, just dirty. Knobs are all there and are in good shape. Working condition unknown.

* Heathkit Model V2 VTVM. Good physical condition. Needs cleaning. Working condition unknown.

TS-352 B/U Multimeter. Meter case is in good shape. The meter itself is clean.
 Working condition unknown.

Several 211 tubes. Working condition unknown.

3 ea. EF Johnson ceramic sockets for the 211 tubes . Sockets are clean (I think).

Also, there are several elderly RF ammeters. I can get a list, if someone is interested.

TEK 511.
Pretty much the real value is in the TEK 570 tube curve tracer.
The 511 is indeed TEK's first mass produced scope, but there's a caveat.

The earliest/original 511's had a single dial for the sweep selector. Later in the production run TEK improved this feature using a "two-dial" selector and offered a retrofit to owners of existing 511 scopes. Most "single dial" 511's were upgraded by the factory. By the time the 511A came along, TEK had made a number of improvements to the 'scope. One of which did away with the brute force HV power supply. I believe they also used an improved CRT, improved calibrator and some other improvements-- the two dial horizontal sweep selector... et al.

So if you indeed have an early 511-- see if it has 1) Single dial horizontal sweep selector, 2) Brute force HV power supply.

As to value-- there are lots of factors-- mainly condition/modifications but don't think you'll be able to sell it and live happily ever after on the proceeds. Maybe $200 on a good day.

Regards,

W1IV, Bob

12585. 1929 Bruce KellyQSO Party Notes and Comments

From: whitebear1122@...
Topic: 12585 Message: 12585

Last night was the first evening of the Bruce Kelly 1929 QSO Party!

I didn't start the BK until around 7 pm or 7:30 last night. Band conditions were good and the dreaded line noise wasn't present so the band was quiet and long. I worked some 18 stations last night including the rare DX'ers VE7SL and VE3AWA, plus worked several East Coasters which is usually a challenge for the Midwest, plus I worked a bunch of Midwesters in MN, CO, WI MI. I didn't hear KK7UV with my own ears although I heard someone calling him. I also heard the elusive W1GIG when I first turned the rig on but couldn't find him after tuning the rig.

I got on this morning, albeit late, and worked two or three more midwest stations. I always have big plans to get up at 6 AM to work the east coast but I can't pry my eyes open that early. hi hi I will be switching the Colpitts over to 40m in a few minutes and look forward to some good 40m 1929 contacts today.

The19 26 push-pull Colpitts was surprisingly working good. Some years it gets jumpy and suddenly jumps 600 to 800 hz but last night it was rock stable. There is a fine line between between loading, grid drive, high voltage, and the antenna tuner. I did slip a sheet of large bubble bubble wrap under it to keep it from vibrating while I'm pounding the key, retightened many of the screws and connections. That Colpitts is amazing in that there is basically no hand capacitance effect because the stator is grounded.

I heard a lot of really nice 1929 sounding signals with just the right amount of chirp to sound wonderful. I haven't heard any of the buzzer (raw AC) stations yet this year. Nor have I heard any crappy signals either.

Temperatures last night were -5F so I had the woodstove going in the background keeping the shack nice and toasty. Glad to work the stations that I did and I hope to work the rest.

If you haven't tried it, the info is up on the AWA webpage at:
http://www.antiquewireless.org/awa-on-the-air.html

40 meters will hopefully be good this morning and afternoon for those long haul contacts.

73, Scott WA9WFA

Hi John, Yes I agree that the "On the Air" page is great. I believe the kudos' go to Richard Neidich. I don't know him personally but I've emailed him a couple of times while getting the log sheets up on the page. 73, Scott WA9WFA

OK, I admit it.... Web searches have turned up little for me on this...

I got a Betamax recorder around 1984 and was going to see if I could bring it up to play old AWA tapes I made.... It came on... The clock is working, I inserted a tape and it loaded the tape around the drum properly (as far as I can tell) then the Power LED went off and nothing would bring on the unit afterwards. The two fuses in the power supply are OK and the clock continues to work.

So anyone here with arcane info about these players... i.e. Known failure modes..
I see a couple of people offering service manuals on eBay... Is it likely to be worth trying to get the manual and dive in?

Robert

Robert -

Lots of bad caps probably... heck there is so much that CAN go wrong...
I deal with similar with the earlier reel to reel Sony units we do
conversions with. we may have an extra manual for your unit but
it will be awhile before I can address that.

We try to have machines from each format ever made up to 2 " video
tape (looking for more 2" quad machines!" some of this stuff is a bear to
keep running even with the talent we have around here.

Sometimes it is easer to borrow someone's that is working dub your
stuff to digital
and relegate the old tape unit to shelf sitter.

There are also some places that are pretty reasonable for beta dubs -
always best to find a place you can walk it to.

A s a reminder WSC special event today In West Creek. WSC site 9:30AM at Murphy Drive

From: Steve [mailto:w2usf@...]
Sent: Monday, December 23, 2013 8:19 PM
To: obarc-l@...; 'sjdxa@...'
Subject: DL100OUI and W2WSC/100 operations Dec 30, 2013

In conjunction with German radio amateurs using the call sign DL100OUI, W2WSC/100 will operate from the WSC site on Murphy Road in West Creek on December 30, 2013 to commemorate 100 years of the VLF Goldschmidt stations in Tuckerton and Eilvese, Germany. This is to be the last operation for DL100OUI. The Germans indicated they will be active on 80, 40 and 20 meters on December 30 until 2359Z on December 30.

Bob Wick, N2HM and I plan CW and SSB operations. OBARC and SJDXA members are invited. Setup at 9:30AM on Dec 30. Please send me an e-mail if you wish to operate.

See QRZ.com details and http://sdrv.ms/Hozzzn for pictures and documents.

01/01/2014

Max de Henseler, HB9RS, the founder and president emeritus of <http://www.4u1un.net/> 4U1UN at United Nations headquarters in New York, died December 30. He was 80. A ham since 1955, de Henseler had been a short-wave listener since the late 1940s. In 1976, while in New York as the UN's chief cartographer, de Henseler reactivated the United Nations Radio Club station K2UN at its new home in midtown Manhattan. As Jack Troster, W6ISQ, explained in the July 1989 issue of QST, "Through his efforts, the Secretary General approved the operation of a specifically designated UN amateur station using the call 4U1UN in early 1978."

De Henseler introduced the new call sign on February 4, 1978, during the first weekend of the then two-weekend ARRL International DX phone contest, surprising many contesters. 4U1UN was approved for DXCC credit, due to the efforts of "Mister UN Radio."

During his UN career, de Henseler, an international Amateur Radio figure, traveled around the globe, operating from various call signs, including ET3RS, XW8HB, 5W1BK, 9Y4RS, EL2DX, HP1HN, 3D2RS, FO0RSM, and DJ0AB. His QRZ.com web page cites de Henseler's "50 years of leadership and contributions to the promotion of international Amateur Radio and the preservation of radio history." He was the first amateur to have communicated with all continents from all continents.

De Henseler was a member of the <http://www.uska.ch/> USKA - Switzerland's IARU member-society - and a fellow of the <http://www.radioclubofamerica.org/80%8E> Radio Club of America. A radio historian, he was a member of the HB4FR <http://www.hb4fr.ch/> "Clin d'Ailes" Swiss Air Force Museum Ham Radio Club, where he established a Hallicrafters collection, and he authored numerous <http://www.w9wze.net/Documents/HB9RS.html> articles in various technical and historical radio journals, including "The Hallicrafters Story - When the Sky was the Limit," and " <http://www.hb9afo.ch/histoire/Salvan.pdf> On Marconi's Trail in Switzerland." He also belonged to the <http://www.antiquewireless.org/80%8E> Antique Wireless Association, the <http://www.qcwa.org/> Quarter Century Wireless Association (he founded the QCWA's Helvetia Chapter 209), the <http://www.sowp.org/80%8E> Society of Wireless Pioneers, and <http://www.arrl.org/a-1-operator-club-roster> A-1 Operator's Club.

He was an honorary member of the <http://www.qsl.net/lidxa/80%8E> Long Island DX Association, the <http://www.njdxa.org/80%8E> New Jersey DX Association, and the <http://www.ncdxf.org/80%8E> Northern California DX Foundation.

The 4U1UN United Nations Headquarters Station was dismantled in 2010 due to the extensive <http://www.un.org/wcm/content/site/visitors/lang/en/home/plan/renovations> renovation project on the Secretariat Building. Security concerns and logistics stand in the way of its returning to the air anytime soon. All antennas have been removed from the roof, and equipment has been packed away. The club is reported to be considering several options to get 4U1UN back on the air as quickly as possible. Some options include controlling the station remotely, putting the station on the ground floor (and running some 400 to 500 feet of feed line to the top of the building), or moving the station to another sovereign UN building. - Thanks to <http://www.dailydx.com/> The Daily DX

Sorry to hear of the news that you shared Geoff. Max was indeed a gentleman and a real nice fellow. I got to know him well and we were good friends for a while when he was still in the states. I did email him a while back, but, never received a reply. Possibly, he was already ill at the time. I was specifically looking for a copy of a book he put together on the 3NF series of tubes. I know I have the book someplace, as he did give me a copy, but of course I have been unable to locate it. I now have about a dozen receivers and amplifiers using that series of tubes and would like to find Max's book again.

In spite of this sad news, I do hope that you all have a healthy and peaceful 2014. 73 - Mike

president emeritus
<http://www.arrl.org/news/search/Tag.name:president%20emeritus>

01/01/2014

Max de Henseler, HB9RS, the founder and president emeritus of <http://www.4u1un.net/> 4U1UN at United Nations headquarters in New York, died December 30. He was 80. A ham since 1955, de Henseler had been a short-wave listener since the late 1940s. In 1976, while in New York as the UN's chief cartographer, de Henseler reactivated the United Nations Radio Club station K2UN at its new home in midtown Manhattan. As Jack Troster, W6ISQ, explained in the July 1989 issue of QST, "Through his efforts, the Secretary General approved the operation of a specifically designated UN amateur station using the call 4U1UN in early 1978."

De Henseler introduced the new call sign on February 4, 1978, during the first weekend of the then two-weekend ARRL International DX phone contest, surprising many contesters. 4U1UN was approved for DXCC credit, due to the efforts of "Mister UN Radio."

During his UN career, de Henseler, an international Amateur Radio figure, traveled around the globe, operating from various call signs, including ET3RS, XW8HB, 5W1BK, 9Y4RS, EL2DX, HP1HN, 3D2RS, FO0RSM, and DJ0AB. His QRZ.com web page cites de Henseler's "50 years of leadership and contributions to the promotion of international Amateur Radio and the preservation of radio history." He was the first amateur to have communicated with all continents from all continents.

De Henseler was a member of the <http://www.uska.ch/> USKA - Switzerland's IARU member-society - and a fellow of the <http://www.radioclubofamerica.org/80%8E> Radio Club of America. A radio historian, he was a member of the HB4FR <http://www.hb4fr.ch/> "Clin d'Ailes" Swiss Air Force Museum Ham Radio Club, where he established a Hallicrafters collection, and he authored numerous <http://www.w9wze.net/Documents/HB9RS.html> articles in various technical and historical radio journals, including "The Hallicrafters Story - When the Sky was the Limit," and " <http://www.hb9afo.ch/histoire/Salvan.pdf> On Marconi's Trail in Switzerland." He also belonged to the <http://www.antiquewireless.org/80%8E> Antique Wireless Association, the <http://www.qcwa.org/> Quarter Century Wireless Association (he founded the QCWA's Helvetia Chapter 209), the <http://www.sowp.org/80%8E> Society of Wireless Pioneers, and <http://www.arrl.org/a-1-operator-club-roster> A-1 Operator's Club.

He was an honorary member of the <http://www.qsl.net/lidxa/80%8E> Long Island DX Association, the <http://www.njdxa.org/80%8E> New Jersey DX Association, and the <http://www.ncdxf.org/80%8E> Northern California DX Foundation.

The 4U1UN United Nations Headquarters Station was dismantled in 2010 due to the extensive
<http://www.un.org/wcm/content/site/visitors/lang/en/home/plan/renovations>

renovation project on the Secretariat Building. Security concerns and logistics stand in the way of its returning to the air anytime soon. All antennas have been removed from the roof, and equipment has been packed away. The club is reported to be considering several options to get 4U1UN back on the air as quickly as possible. Some options include controlling the station remotely, putting the station on the ground floor (and running some 400 to 500 feet of feed line to the top of the building), or moving the station to another sovereign UN building. - Thanks to <http://www.dailydx.com/> The Daily DX

12609. Want to Buy: Two Miller 1730 IF Transformers

Greetings and Happy New Year from the Frozen Tundra of Minnesota. Brrrrr..

Want to Buy: two Miller 1730 IF Transformers. I've just completed a major radio sell off that consumed most of my radio time for the past 3 years. I am now ready to get back to my Home Brew Receiver (HBR) receiver project, a 12 or 13 tube superhetrodyne receiver designed by Ted Crosby W6TC back in the 60's and featured in QST.

I want to buy two Miller 1730 IF transformers, they are 1800 Khz so sort of an oddball. If I can't find any then I'll proceed with a set of ARC5 BC-454 1415 Kc IF transformers that I just acquired, but I'd like to take one last look for the 1730's before punching the chassis. Can you please check your junk box for me?

Thanks. Best Regards, Scott WA9WFA in Saint Paul MN

A guy in Raleigh passed away with what looks like some high class test equipment. His son now needs to sell it...

Other than having some passing knowledge of the Tektronix 576 curve tracer being adapted to test vacuum tubes, the other stuff is just something I've not followed...

Any brief comments you could provide would be helpful...

I put the stuff on one of my web pages: http://kd4hsh.homestead.com/raleigh.html
http://kd4hsh.homestead.com/raleigh.html

Thanks,
Robert

I initially placed my bid about 2 hours before auctions end. At that time there were no other bids on it with a starting price of $199.95. I placed my bid early as I had another commitment that would not allow me easy access to eBay. Later I found out that another bidder incrementally kept on bidding the item up, and, eventually became the winner. A few minutes after he won, he retracted his highest bid only, but, all of his other bids remained. In effect, he made me pay more than twice what I should have, had he not bid at all, which was the implication by retracting only his winning bid. At the time, I did not realize who the other bidder was, and, had wrongly assumed he was a shill for the seller, trying to get to my maximum, and then backing off. Regardless, as it turns out, the other bidder is a good guy, whom I know, realized he already had the item, but being it was close to auction's end, was only able to retract his highest bid.

I already have a couple of transformers like that one. One physically smaller with a 10KV output and one the same size as this, but also with 10KV output. This one is rated at a 25KV output. I hope the secondary is intact, as the wire must be awfully fine for that many turns on that form, and, the cover over the secondary does look dented on one side possibly either causing an open, or shorted turns. It will still be a nice addition to the collection. Thanks & 73 - Mike

I use esnipe for my ebay transactions. It only cost pennies for the service, and you pay only if you win. I always set a limit of how much I think something is worth and with esnipe my bid only goes in within the last several seconds. This way I can't be incrementally bid up. This practice might not seem fair to some but I feel that all is fair in love, war and auctions, and besides, these sniping services are available to everyone so it's not like I have a tool that no one else has available..

A few minutes after he won, he retracted his highest bid only, but, all of his other bids remained. In effect, he made me pay more than twice what I should have, had he not bid at all, which was the implication by retracting only his winning bid. At the time, I did not realize who the other bidder was, and, had wrongly assumed he was a shill for the seller, trying to get to my maximum, and then backing off. Regardless, as it turns out, the other bidder is a good guy, whom I know, realized he already had the item, but being it was close to auction's end, was only able to retract his highest bid.

I already have a couple of transformers like that one. One physically smaller with a 10KV output and one the same size as this, but also with 10KV output. This one is rated at a 25KV output. I hope the secondary is intact, as the wire must be awfully fine for that many turns on that form, and, the cover over the secondary does look dented on one side possibly either causing an open, or shorted turns. It will still be a nice addition to the collection. Thanks & 73 – Mike

A very interesting topic for the group, as we all do some buying or selling on eBay.

I was an early adopter in 1999, or so and learned about sniping the hard way. When I really wanted an item on eBay, I would sit at my computer watching the computer clock waiting until about 20 seconds to push the buy button. This was Windows 98 or earlier, on dial up…. so sometimes the computer would freeze up or not send immediately. The biggest problem was eBay auctions that ended when I was at work or in bed. Back then snipe programs were unknown to me and were likely not commercially available.

When they first became available, they were too expensive for me to justify for a hobby. Finally when the price came down, I bought a one year subscription for about $99. I have never looked back. I can set my top bids on any number of items, many days before an auction ends, and forget about the whole process. The highest bidder still wins, but at least my bid was placed, and I get a fair shot.

I still lose many more auctions than I win, but that is because of international bidder being willing to pay higher prices. Don't fight technology!

By the way, before you list your spark item on eBay, how about posting on the Spark Gap Collectors site telling the guys who don't troll on eBay regularly…. what you have for sale?.

Happy collecting!

if you purchased from him you should have the whole ID.
Do you mean he was bidding against you and ran the price up Mike?
check the usual suspects and look for a feedback # that is the same..
the opposing bidders ID is masked but not the #'s of feedbacks as I recall.

I must be really naive, because i never heard of an auction where you could retract a bid after
the auction closed. Well.....you could -- and be evicted from the auction and blacklisted. Or the fellow whose item was relisted. I really don't see the payoff for the seller on that one.

I have a DTW (Berlin) German army portable spark transmitter i may be offering later this year, after i retire and can dig it out. It is about 24 x 12 x 12 inches, has built in key and RF
ammeter, quenched gap, 24 volt operated. I don't want to sell it, rather, swap for some uncommon item of WW2 radio. Something like an E52b receiver. August Link also has one of this same transmitter. (Of course.) He actually supplied me with a cover for the interrupter
unit. Imagine, having spare parts for this!
I have a letter from the manufacturer verifying the date and manufacture.

I have had this happen a couple of times when I sold something at a great price because a naive bidder went way overboard on his bid. He can only retract his bid, if he claims he made a mistake, like adding an extra zero. I see both sides of that situation, but it is easy for someone to lie, when he just has buyer's remorse I suspect some bidders do this far more often than the typical ethical bidder.

It works like this
A seller has someone he knows bid against others to up the price. If he wins he releases his friend from the auction and realists the item. More often than not he stops when the bud gets to where the seller wants thus running the buds up

I see the shill bidder logic, but what's the payoff of relisting the item? There's no guarantee whatsoever
that the price will climb again to what the seller wants.
I have seen some items relisted a half dozen times altho it was clear that people were just not going
to pay the reserve.

So how does a seller cancel the sale after the auction closes? That seems like a criminal violation,
a contract broken.
I only tried to cancel a sale once, having seller’s regret, but it turned out to be too late to cancel
the auction. Now, it’s oh well, I can continue to breathe without owning that item, after all.

If the buyer contacts eBay's resolution center, he can fill out a request to cancel the sale for one or two possible reasons. If the seller agrees to let him out, eBay refunds the seller fees, and the buyer is off the hook. If the seller will not accept the sale cancellation, the bidder gets a black mark on their record for refusing to pay, and could be suspended from eBay. Unfortunately, the seller is either left holding the bag, or can offer the item to the next seller. My experience with next highest bidders is that the bidding frenzy is over and they often decline to pay what they had bid up to. It's not a perfect system, but most buyers and seller are honest.

Bids may NOT be retracted after an auction closes.

Mike had misspoken - per the auction page, the opposing winning bid was retracted Jan-11-14 14:00:38 PST and the auction ended Jan-11-14 15:24:45 PST.

The way I interpreted Mike's info is that the other bidder had slowly bid up until he found that his bid was at the top and would be the winning bid. Sometime between then and the end of the auction, he realized that he already had the same item so retracted his top bid, thus leaving Mike's TOP bid as the winning bid...thus costing Mike much more than if the intervening bids had not been made. So this all happened before the auction ended. I'm not sure how many bids that he could have retracted but once realizing that he didn't want the item, he should have retracted all of his bids...certainly seems that Mike got nailed unfairly. Maybe it happened differently.

You guys are aware that one can do a proxy bid where you enter the highest amount you are willing to pay and your bid will automatically increase by the minimum amount of a bid increase to make you the top bidder at that time. As long as your highest amount is higher than other bids you win. Of of course, if someone places a higher bid than your high proxy bid, they win. The secret is to sit waiting for the end time and enter a higher bid about 5 to 10 seconds before the end. Of course you have to be willing to know when to quit and not go higher than the item is worth to you.

Armstrong Fans;

On the night of 30 January 1914, Edwin Howard Armstrong, accompanied by Professor Morecroft from Columbia University, demonstrated his regenerative receiver to David Sarnoff and Roy Weagant of The American Marconi company at the Belmar receiving station, then under construction. Join us at InfoAge in Wall Township, New Jersey on 8 or 9 February 2014 to commemorate the 100th anniversary of the historic event.

Get the details: http://www.rtm.ar88.net/Armstrong_Days_at_InfoAge.html

See you there,
Al

From: Ludwell Sibley
Topic: 12640 Message: 12640

Passed from the Tube Collectors Association reflector:

+++

There are 2 Philips 4662 1930s-40s Neon tuning indicator tubes on E-bay. Buy it now 310803985740 They are going for $99.99 + shipping. These don't seem to be very common. Disclaimer, not my auction, don't know the seller etc.
Tim Laing

+++

For those of you with '30s radios having dead Tune-A-Lite neon tuning indicators, this is an opportunity to pick up a spare.

Not my auction or my buddy either.

Ludwell Sibley

12642. Atlanta Antique Radio Swap Meet & Auction on 2/15/14

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-01-19 01:52:32 UTC
From: Richard Rodgers
Topic: 12642 Message: 12642

The Southeastern Antique Radio Society will be conducting our annual Indoor Swap Meet and Auction.

February 15, 2014 from 7 AM to 2 PM (no sales before 8 AM)
Jim Miller Park
2245 Callaway Road
Marietta, GA 30006

* Ron Ramirez, also known as Mr. Philco, will be our guest speaker.
* NO admission or auction fees whatsoever.
* Free auction for all buyers and sellers.
* The facility will open at 7:00 AM for dealer set up. Dealers pay $15.00 for each 8 foot table and one chair (see below for table pre-registration option).
* No sales will occur before 8 AM.
* 50/50 cash raffle (winners take home more than $100)
* Complimentary donuts, coffee, bottled water, pizza and soft drinks are available (donations appreciated)

The Jim Miller Park indoor facility is the perfect venue for our growing event. It is three times larger than our previous location so it will accommodate many more buyers, sellers and display areas. Eight foot tables are now available to sellers and there will be plenty of space for larger sale items such as console radios. The facility features ample parking, easy loading and unloading access, PA system and restrooms. We expect this be the biggest and best event yet.

From: ALAN MCCORMICK
Topic: 12643 Message: 12643

Hi All,

I'm working on an L600 TO and want to replace the selenium rectifier with a 1N40XX diode. A seleniuim rectifier drops about 5V; a 1N40XX has a forward drop of about .6V. ..... Should I increase the value of the series resistor to compensate for the voltage drop difference or just not worry about it? ... If so any suggestions for an appropriate value for the TO?

Hi Alan,

How about putting a 4.5V (or 5V, should be close enough) Zener diode in series with the silicon rectifier diode, to achieve an equivalent voltage drop? Just an idea, I have no specific experience attempting this with a TO (mine still has its Se rectifier).

73,

An easy solution is to stack several silicon diodes in series.

I used 130 ohms, three watts, in series with the diode. This gave the "original" voltage on the B+ bus.

I did a run of three T-O restorations long ago, and wrote them up in "Radio Age" (May 1995). In one of them, the obsolenium rectifier would work fine at the start, but after warming up would turn into a voltage dropper.

In two of the sets, the 50A1 ballast tube was open or missing. No problem: bridging its socket terminals with a 1000-ohm, 4-watt resistor, and wiring a 1N4739 9.1-volt zener across the filament string to get "stiff" regulation, fixed that problem.

Hi Richard,
 Google Frank's electron tube pages.
 At a glance, it appears to be similar to, but not identical to the 53/6A6/6N7 series of dual triodes--a high mu power type, designed for push pull audio output svc, etc.

An odd duck. Here're my notes on it:

1635 Rcvg. duotriode, low-distortion high-μ Class B type,
low-heater-current, T9 bulb on octal base; heater 6.3 V @ 600 mA, μ 65,
diss. 3.3 W per section (4.5 W for variable signals) (registered by RCA in
RMA Release 347, 9-24-43) {dev. no. A4193} (.W. also sold it), basing <8B>.
Sections have common cathode. Dev. for government use; "particularly used
for underwater sound" (sonar?}. Announced by RCA 1942; sales limited to
existing inventory 1971.

It's documented in a 1947 page in the RCA HB-3 handbook, for those versions of the book where the page wasn't later discarded.

The <8B> basing is same as the 6N7 used.

A known use is in the recording output stage, with the sections wired in parallel, in the Signal Corps TT-1/TXC-1 facsimile transceiver ("surely" not a Class B application!).

Thank you to all who have replied to my query.
What a great resource we have with this group.

For those who might be interested:

This small rig has a 5763 crystal osc followed by a 2E26 final amp.
The audio section has a 12AU7 and the 1635.
The next step will be to produce a wiring diagram.

Thanks again for the excellent and very timely help.

Best regards,
Richard W4LN

We're talking carbon-grain mikes. The single-button version has just a diaphragm that vibrates, backed-up by the carbon granules and an electrode that completes the circuit through the carbon. Think "telephone," at least before electret and other electronic versions took over.

The double-button model, unique to broadcast and recording uses, had the same diaphragm, but carbon grains and their contact electrodes on both sides of it. It operated in push-pull fashion. Supposedly gave better quality / less distortion than the single type. Probably gave more output also.

Tom, George, I have several ARC-5 receivers. Most of the potted caps were leaky (physicaly & electrically) I pried the edges open and removed the guts, replaced them with polyprop caps and closed them up again with the original terminal disk. They're not too pretty but they work fine, last a long time. I don't know what the liquid in them is, but I wouldn't spend too much time with it on my hands. Same with the bath tub caps. Don't use heat to open them. They may explode. Sacrifice a sharp chisel to split the seams and remove the backs. Clean them out and replace the guts. When replacing the backs, just a spot or two of solder is all that's necessary, unless you're going to take it under water with you.

I am working on an article for the AWA Review... I've been searching for info on a DC-AC converter option used in my 1937 Philips D57AU radio and coming up with zip...

As usual, turns out I was not using the right search criteria... It is on radiomuseum.org and I still don't have access to that...

If you have time, can you snatch the following?...

http://www.radiomuseum.org/r/philips_7880c7881c.html

Schematic and installation instructions...

There are other versions of this crazy thing... I'd like to have the schematics & write ups on these if you can...
http://www.radiomuseum.org/r/philips_7882c.html
http://www.radiomuseum.org/r/philips_wechselrichter_zerhacker_3.html

The D57AU is a terrific sounding radio.... No pre-war US table radio can compete on audio quality...
But this scheme for making it a AC-DC mains set has to be the most complex I've ever seen bar none....

Only Philips....

Robert

Tnx Ludwell for the reply,
I took your information and researched further.
I have an American Microphone Model EL.
It is a double button carbon per a few hits on google.
The mic should be suspended between 8 springs to the stand.
There seems not to be any continuity between any of the contacts.
I'm hoping to find some written procedure to restore the mic.
Any help would be appreciated from the group.
I have a source for a DB to grid transformer if I can get it working.
I have the ideal 1930s xmtr to pair with.
Regards
bob...w2ami

For what it is worth.... I have had several double button carbon mikes. The carbon granules are held in place just by felt washers. Insects eat the felt and the grains fall out! Thus the open circuit...

At a hamfest I found a guy with a pill bottle with maybe two tablespoons of carbon grains.... I think he wanted 50 cents.... Exactly what I needed!

Robert, thanks for the info. I have a double button mike that's been sitting in a box in my workshop for at least 40 years. I'll have to get it out and check to see if the bugs have got to it.

Leonard

I'm not going to open my DB Carbon mic until I find carbon to fill it up.
I found a number of sources for activated carbon granules used to filter water.
Will they work? Some are made from bitumis coal - others charcoal.
Carbon is carbon when pure ?
I also thought about crushing the carbon rod from a carbon/zinc battery?
How much carbon would I find in an old telephone mouth piece?
Any thoughts out there ?

12675. New Additions to My Site

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-02-02 20:00:35 UTC
From: Dale H. Cook
Topic: 12663 Message: 12675

After talking with a number of folks at the recent winter meet in Mebane NC I decided to start scanning and posting (as PDFs) some items from my collection of paper. Because they are scanned at 300dpi to preserve quality some of the PDF files are rather large.

The first group of items consisted mainly of manuals for some Philco test equipment of the late 1940s for Robert Lozier, who owns a pretty complete set of that equipment. They are at:

http://plymouthcolony.net/starcity/radios/pages/testmanuals.html

In recent days I have begun to post some of the vintage parts catalogs and parts data sheets from my collection. Those currently available are:

Cornell-Dubilier Catalog 128 (1935)
Cornell-Dubilier Catalog 158A (1941) and the matching price schedule
Jefferson Electric Co. Catalog 371-R (1937)
Mallory-Yaxley Catalog M-760 (1938)
Mallory-Yaxley Catalog M-770-A (1940)
Meissner Catalog 54B (1954)
Five Meissner Data Sheets (ca. 1935-1950)
J. W. Miller Catalog No. 38 (1938)
J. W. Miller Catalog No. 58 (1958)
Thordarson Catalog 400-D (1939-40)

They are available at:

http://plymouthcolony.net/starcity/radios/pages/partscats.html

The next phase will be some of the replacement parts guides from my collection. When used with the parts catalogs they can be a valuable resource. I have, for example, the Thordarson Replacement Transformer Encyclopedias covering the first nine Rider volumes. When used with the already-posted catalog they can help to determine a suitable replacement transformer for the repair of a receiver.

It will take some time to add to the items online as I have many demands on my free time including extensive involvement in a major genealogical project. I am open to suggestions about the types of items that I should post. For example, I do not know of an online copy of the fifth edition (1946) of the Mallory Radio Service Encyclopedia, which I have long owned and have used extensively. If there is enough interest I am open to posting that, but it would take some time and quite a bit of work as it consists of nearly 500 pages.

Hi Bob,

I would think "carbon is carbon," however the only source of replacement granules for a microphone I have heard used successfully is the crushed carbon from a Leclanche cell idea. (That doesn't mean other sources wouldn't work, it just means I have never heard of them being tried).

I have had limited results using graphite ground from a lead pencil wiith sand paper. I repaird an rs-38 mic, but no joy on a t-17. I hammered out some carbon chuncks from a large nr6 dry cell, then put the chunks in a counter top small coffee grinder and ruined the blades. The dry cell carbon was as hard as ceramic. Perhaps a D cell carbon is softer? I have found that the amount of carbon in the mic is critical. Let us know if you are successful.

Y'know, in the old days people talked about "coal-grain" material being used in telephone transmitters, and about the stuff being treated anthracite.

Maybe the cure is to bust open a couple of old telephone handsets and extract the contents..

Hello Dale,
Nice job on the catalogs.
I especially needed your Thordarson.
A rare one to Google is an early UTC Transformers catalog.
The earliest and only one I can find is a UTC 1963.
I would like to find the specs on a UTC Choke PA-103
and it looks 1940s.
Be well,

When I was looking at my T-17 mics last year and attempting to repair some of them I ran into one which had the mic capsule integral with the mic body so it was not possible to replace the capsule. But I did look closely at the carbon granules that fell out as I took it apart and they did resemble anthracite. Hard, sharp edged and quite shiny - almost sparkled in the bright light over my work bench. So mayve they are/were basically hard coal. Something we had by the truckload at my father's house but that I have not seen in 50 years or so.

The Thordarson replacement encyclopedias covering the first nine Rider volumes are done, as are several other parts replacement guides, but I have four more guides to finish before the parts replacement guides page will launch. I will announce its debut on the list.

>The earliest and only one I can find is a UTC 1963.

Unfortunately 1963/64 is the only UTC catalog that I have. Did the PA-103 choke come out of something manufactured?

I found the voltage online at:

http://www.technicalaudio.com/pdf/UTC_United_Transformer_Corp+TRW+OPT/UTC_Catalog_1936.pdf

That is not actually a catalog - it is a technical publication entitled "The UTC Transmitter and Public Address Manual." On page 34, under Class B Swinging Chokes, the specs of the PA-103 are given as 5 to 25 henries, 20 to 200 milliamps, 600 volts maximum DC operating voltage, 110 ohms resistance, and a 1936 list price of $8.00.

Wm. Perry Company, Louisville, KY
probably has what you want.

You have to call him.
Don't have his number handy, but you can Google it.

There actually is likely a more direct solution than a chassis hack and a bunch of uncalled for work.
I recommend you cast a wider net than the smaller and nonspecialized AWA.
I suggest an inquiry about TCS connectors to the milsurplus or armyradios online groups.
(Possibly just the threat to change out the original connectors might scare up some for you, hi.)
I do not think TCS connectors are at all rare or particularly difficult to find.
Tell you what, I will forward the original query to these two groups.
The may reply directly to you.
Good luck. The TCS is a popular AM rig.

Hi Kevin. This may not help, but what I've done in the past is replace the connectors with modern connectors from Digikey. They're not cheap, but at least they don't stand out like brown shoes with a tuxedo.

Hello Everyone,
I am restoring a WW2 Collins TCS12 radio and need help! I am looking for anyone that might have or know where I can get the canon connectors used on the transmitter, receiver, control unit, and power supply. Please see below for the part numbers needed for the cables and connectors used with the radio.
By the way, I have the original Navy Manual Instruction Book (Restricted), dated November 1942, about 2 inches thick full of information on the TCS radio and all Accessories: i.e. schematics, drawings, mounting configurations, cables, power supplies used, and much more. If you need any information from this book, please let me know and I will digitally copy and send it to you. Please don’t ask for the complete book, it would be too many pages to scan and I don’t really have the best scanning equipment on hand, etc.
Thank you,Kevin L
Gilroy, A

Got this reply. Another person also replied that he had just recently seen them on Ebay
-Hue

Hugh,

I either have or can get the connectors. What he lists as cable is actually flexible conduit (the individual wire was supplied in bulk). He'll be better off using the 21C-5/8 or 23C-5/8 backshells and locating multiconductor jacketed cable. The "C" suffix backshells have integral cable clamps. If he uses the AC&AN backshells, he will also need one AN 3057-8 screw-on cable clamp for each connector. That's how Collins actually did the jacketed cables but I think only because they had the AC&AN either in stock or in the supply chain because that's what was required to work with the conduit. The conduit style cables are fine for a permanent installation but are very difficult to use for maintenance on the bench because they are quite stiff.

Hue,

I have a complete set of cables for a TCS set up If he wuold be interested. BTW, there is TCS connectors available on EBAY, but not all. I think Jim Williams still has some, and Bill Perry may still hve a few. Robert Downs has been a good source of TCS stuff in the past. I have a TCS setup running here. actualy two of them, one on the deck on Dynamotour power and one in the shack on AC powere.

Hello, all. My name is David and I am in Reading, MA collecting 1930s and 1940s era table tops and floor mdels. I have put together a wish list of stuff I need and before I go to a store want to see if any of you have any of the following and, if so, how much to ship to Reading, MA?

1. Dial cord
2. Dial springs (harvesting pens doesn't seem to do the trick, need correct tension)
3. Knobs of the type in the attached photo. MUST have the the clips inside the triangle in back
4. An on/off switch with a 500k ohm potentiometer, on a 1 5/16" shaft

5. I also collect deco dial faces, if you can shoot a picture of what you have and tell me the price.

Thanks

David,

Radio Daze sells all those items.

http://www.radiodaze.com/

The volume control is better at parts express.

http://www.parts-express.com/500k-audio-taper-potentiometer-with-switch-1-4-shaft--023-600
500K Audio Taper Potentiometer with Switch 1/4" Shaft
These volume controls work fine. I have purchased some at other vendors and
the volume would not go low enough before the switch turned off. These
controls do not have that problem the volume goes to zero like it should before the power
is turned off.

Tom, N4TL

Hi All,

Charles Stinger, W8GFA - a great Historian on Crosley and Doron Brothers of Hamilton Ohio, passed away Saturday February 15th - 89 years old.

He worked as manager at the Cincinnati Voice of America VOA station for many years.

I am so Sorry to hear about Charlie- I remember meeting him at my first AWA Meet in Canandaigua, NY in 1975.

He had a great sense of humor and was very knowledgeable about early wireless and all facets of ham radio.

RIP Charlie- one of the Grand Old Timers! He was one of the original AWA members

Here is his obit:

I also had a problem with paint turning to powder.
It was on a Magnavox horn with the big square base.
I spit shined one layer of Kiwi black shoe polish
followed by several layers of Kiwi clear. It made
the decal a little darker but its still visible.
That was 20 years ago, and it is still shiny today

Ron -

One way is with a regular spray paint can, but open up the hole in the nozzle. It takes some experimenting to get the
size droplets you want.

A 1/16" drill bit is a good size to start with. Spray from a couple of feet away.....

Let us know!!

Date: 2014-02-26 14:47:53 UTC
From: whitebear1122@...
Topic: 12720 Message: 12720

Gang, Here is the preliminary list of 1929 QSO Party logs that I received via mail and email. This is the first draft. I need to go through the pile of logs tonight and double check to make sure they all got to the list, and the recheck the numbers . If you sent in your log and don't see it here, please let me know. If you didn't send in your log, you still can and I encourage you to. I will getting this off to Tim W1GIG this coming weekend so stragglers have one last chance :)

I always start this years list from last years list, adding and deleting as necessary. I noticed maybe 10-15 log submissions less this year. Like usual I will go through each log and extract all the call signs of stations operating in the event so we can see who all partipated but didn't send in a log.

From going through the logs, it looks like everyone struggled with poor propagation and static. Many scores are down by maybe 10 to 15 contacts. Lots of comments about propagation, not hearing as many, and static. I know at my QTH 40 meters was nearly worthless both weekends and I was counting on 40m big time. 80 meters didn't seem to go long much. I heard only a fraction of the New England states as I normally do.

There are several guys who always impress me with their 29 operation because t hey use homebrew regen receivers for part of the event. Wow!

Did you know California was on the air for one contact. WA6VYN. Howie WB2AWQ/7 was the lucky QSO with California. Lets try to encourage WA6VYN to give out more QSOs next year!

Thanks. 73, Scott WA9WFA

12724. Hello (Introduction): One Tube Regen

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-02-27 02:34:13 UTC
From: Chris Maness
Topic: 12724 Message: 12724

Hello, my name is Chris callsign KQ6UP, and I am slowly putting together a late 20's early 30's vintage amateur radio station. I have built a one tube regen so far, but I need to start changing out parts to make it more authentic. So I have a few questions:

1. I am using the high tension side of an automotive ignition coil as an audio frequency choke, and taping my audio to a crystal radio earpiece. This is working VERY good. One tube setup almost needs no audio amplification. What could I replace it with that would be period correct, and where can I find one?

2. Where can I get sheets of black bakelite for the front panel? I have looked around, but I am not sure exactly what I should be looking for.

3. I am running a #32 tube, and I would like t have a meter to check the filament current. What would you recommend for period correct meter?

4. Suggestions for coil forms would be good too.

Here is my setup:

http://www.flickr.com/photos/81639412@N00/tags/regenerativereceiver/

Thanks,

Chris Maness KQ6UP

Hello-

item #1: It’s good to hear that a one-valve receiver works that well. I have long wondered about the
ARRL’s Novice book, single tube (3S4 ?) receiver, and whether it would work out for actual on-air
communications. I would use piezo headphones also, but my favorite: Brush Phones.

Anyone know what the inductance of an ignition coil would be? My LCR instruments only do up thru mH. I know I COULD rig up a breadboard test, but I don’t have time to think about that now.
(I recall a Lafayette VOM I owned back in the bad old 1960s that actually had an L range, with
the high inductance range ONLY of H’s, not mH of course, due to its simple 60 Hz measuring.

item #3: You can be sure in the 1930s and 1920s no one measured filament current. They just measured voltage. If you REALLY want to be original tho, instead, I think you’d have to put a
resistor in series with the filament, and then measure the voltage across the series resistor,
and then maybe mark your meter with a new scale. Or if you still want to measure filament current, use DC and buy some common hamfest meter, and if you can’t find a range large enuff, parallel it with a slide-adjust wirewound resistor. But I think you’d be best to just
put a voltmeter there and call it a day.

Subject: [AWA] Hello (Introduction): One Tube Regen

Hello, my name is Chris callsign KQ6UP, and I am slowly putting together a late 20's early 30's vintage amateur radio station. I have built a one tube regen so far, but I need to start changing out parts to make it more authentic. So I have a few questions:

1. I am using the high tension side of an automotive ignition coil as an audio frequency choke, and taping my audio to a crystal radio earpiece. This is working VERY good. One tube setup almost needs no audio amplification. What could I replace it with that would be period correct, and where can I find one?

2. Where can I get sheets of black bakelite for the front panel? I have looked around, but I am not sure exactly what I should be looking for.

3. I am running a #32 tube, and I would like t have a meter to check the filament current. What would you recommend for period correct meter?

4. Suggestions for coil forms would be good too.

Here is my setup:

http://www.flickr.com/photos/81639412@N00/tags/regenerativereceiver/

Thanks,

Chris Maness KQ6UP

Try oldradioparts.com he has supplied me with nice old parts, filament resistors, binding posts variable caps and grid leak resistors, etc. Take a look at eBay for old tubes, 01As, etc. I've picked up tested good 01As for $5 or $6 each.

The Pilot Wasp is a good unit to duplicate and Pilot coils turn up quite often. The Super Wasp includes a tuned RF stage, an upgrade that makes it a useful 1929 receiver.

This post has a good point in that probably no 1930s ham used a single tube receiver, so a larger receiver would actually be more period realistic. I have quite a few QSLs from the 1930s and I can tell you, the simplest receiver listed on any is a 2-tube. Actually, unless you emulate a professional level receiver from that era, it wouldn’t have had a voltmeter of any kind, either. If you use resistor condenser coupling between the stages, you won’t need any high inductance chokes.

The tube is a #32. That is a directly heated 2V cathode that runs on flea power. The filament is not even visibly glowing on this tube nor does even get warm. It only draws 60mA. I was thinking they might have used a current meter something to know when their accumulator (lead acid filament battery) was dying, but I guess measuring voltage across the filament would be the equivalent. I have noticed a lot of early receivers used a reostat to control filament current/voltage. Some designs even use this for regen control. I have seen a few early receivers (or reproductions) that have a filament meter on their receiver.

I don't plan on leaving it as a one tube regen. It lacks sufficient volume on all but the stronger stations. I can here it all in there though so that is a good sign. The next stage will probably be a #30. I have another #32 for an RF amp.

What coil forms do you guys suggest for period authentic receiver?

Thanks,
Chris KQ6UP

One more comment. Aren't most receivers from that period transformer coupled between stages? Or slightly later choke and capacitor coupled. Those old tubes have a fairly low mu, so I am thinking they needed the most efficient energy transfer. A resistor and a coupling cap is the cheapest and easiest for sure, but just trying to stick to the spirit of the thing. Swapping out the resistor for that it ignition coil boosted the volume by about 50%. I had tried a whole range of resistors. 5K was the best. I think I made a mistake on the 900H bit. It is probably only 10H, but that still has a fairly high impedance at 1kHz. About 60k from my quick head calculation. The nice thing about the inductor is that it allows the DC to flow to put the tube in its highest transconductance range, but blocks out that audio to pass along to the headphones or the next stage down the chain. I am not an radio historian at this point, so you guys feel free to correct me if I am wrong here.

Thanks,
Chris KQ6UP

Hi Chris and welcome to the list,
I have seen this material suggested for bakelite/hard rubber panels.

http://www.mcmaster.com/#catalog/116/3587/=qvgw8r

They may also have something you could use for coil forms.
On the fil. meter...I think the usual method was to use a voltmeter
with a rheostat. I built a one tube regen from 1935 using a 30 tube.
It works quite well.

Hello Ron,
I for one, wishes there were a AWA net that would take place everyday on 40 and 20 Meters, just to have a "Hangout' place with other like minded people who operate 40M or 20M SSB. Maybe a place to try out your Eico "Seven-Drifty-Three" without suffering the maschinations of other members telling you you're "Drifty" - HI! I think you can get the picture.

If anyone comes up with such a frequency or "Net please let me know. You'll hear me a s I S t a r t t o d r i ft

Hi Chris, welcome to Glowbugs and the joy of playing with retro-radio technology!

Typically a regen from the late 20's or early 30's would use transformer or choke coupling between the regen detector and 1st audio, although capacitor coupling with a resistor load in the regen plate circuit was not unheard of either. If the regen detector was a triode you would usually find xfmr coupling, and if a tetrode or pentode, choke coupling. The reason is that the plate resistance of a screen-grid regen detector is very high - hundreds of thousands of ohms - and it was easier to realize a high-impedance plate load with a large choke than with typically-available transformers. A resistor for the plate load was not unheard of, though - the AC Pilot Super-Wasp of (IIRC) 1929, mentioned here by Barry Williams, used a resistor in the plate load of its 227 triode detector. This is not as popular as using a resistor in the plate load of a screen-grid detector, because with the lower-Z of a triode a step-up audio transformer could be taken advantage of to increase the overall gain.

The National SW-3 used a National part that included a hi-L audio choke, coupling capacitor, and (IIRC) the grid load resistor for the audio tube; it used a tetrode or pentode as the detector (depending on vintage/model).

For your type 32 detector, you may want to try a 250K - 500K resistor as the plate load instead of the choke, and a higher plate supply voltage - preferably variable - to compensate for the voltage drop across the resistor.

In any case, a resistor for a plate load in a regen would not be "incorrect" for any regen of 1929 or later design.

73, and keep us "posted."

It also seems that National/Millen/Lamb believed that the choke system had
better audio frequency response than a typical mid to late '20s transformer.

The Super Wasp and AC Sniper Wasp use a different tube line up. I enjoy
the AC Super Wasp, though an extra hand or two would be helpful. You
adjust the RF tuning, Detector tuning, antenna coupling and regeneration.

The SW-5 ganged the RF and Detector tuning. As I recall Lamb worked as a
consultant to Pilot, then to National.

Awesome that confirms my suspicion in regards to interestage coupling.

I am having an issue with a 60Hz note FMing my CW notes. It is was much worse when I was using a bench supply for the filaments. I am running pure battery power now, but I am still hearing it. I am thinking I might have to encase the whole receiver to eliminate this hum. Any suggestions?

I have had to make my throttle capacitor HUGE, and it has limited functionality. I am thinking might be asking too much to have one coil cover 80 and 40m. I am using an ARC5 coil for the tank. I had thought to just use the screen grid voltage for a throttle. However, that would probably lower the AF volume while reducing the regeneration. I might have to wait until I put another audio stage before I do that. Thoughts here?

Headphones: I looked into the Brush headphones, and those appear to be a crystal set. My understanding that the armature types are the most sensitive. An old timer recommended Brands to me. However, I probably won't need the sensitivity if I have an audio stage.

I also saw a neat acoustic cavity filter in August 1928 or 29 (I can't remember) for narrow CW reception. I thought that was pretty neat.

Thanks for the Help,
Chris KQ6UP

Chris,

Let me know if you got the two batches of information. Pilot used two variable caps in parallel. One is set to 0 or 100 and the other is used to adjust feedback. I think both are 100 pf.

Millen wrote an infomercial on the design of the SW5 showing various attempts at reducing hum modulation. Pilot added additional boxes to the chassis, one for the RF amp and another for the detector.

You will see in the SW2 article, it was designed for the spinning disk mechanical TV. It needed wider frequency response, so Millen and Lamb did not use transformer coupling.

Something not mentioned was that the filament wiring used the voltage lost across the filament resistor to appear as fixed bias on the detector grid. So if the A battery was 6.3 volts, 1.3 volts would appear as the fixed bias. The remainder of the bias was from the grid leak resistance. Pilot recommended that you try various values for the grid bias. Typical bias resistors included a graphite pencil mark on paper. Thicken or erase part of the mark to vary the value. Only problem was that the paper was hygroscopic so the value varied with humidity. Original Pilot grid bias resistors were built like this, then sealed in a glass tube.

Yes, I read a similar article for the SW3. It is surprising how forward
they were with their design process back then.

Fascinating. I have just recently felt like I fully understood how grid
leak bias works. It kind of seemed like voodoo magic until it came to my
mind's eye what is really going on. The grid leak cap is peak charging on
the negative swings of the tank, and the grid itself acts like a little
diode. The cap will charge towards leakage if the resistor is absent. It
starts to motorboat if I take it out of the circuit, so the resistor sets
the bias. It seems to also act as a clamp in a way. I think that is why
low mu tubes seem to work as good as high mu tubes for one stage regens.
It just takes more cycles of feedback for the low mu to get the grid leak
bias up to the point the negative bias puts a hold on the runaway
regeneration.

Just my thoughts on grid leak bias. Kind of ingenious, but it is probably
very like found by accident looking at early engineering like some sort of

hap hazard shooting in the dark -- especially when the Audion was first invented. The inventor of the Audion had NO clue how it even worked.

Thanks,
Chris Maness KQ6UP

Hi Chris,
I had a hum problem, with my 24A/27/27 regen receiver.
I added a grounded shield. that enclosed the detector tube, and grid leak assembly. This helped considerably, but I still had a significant hum problem.
Utilizing my xmit antenna (a full sized, resonant, outdoor dipole), in lieu of the short, random length indoor antenna, that I previously used, provided a further substantial hum reduction.

I also tailored the size of the interstage audio coupling caps, and cathode bypass caps, to reduce the low freq response of the audio stages. The latter steps would not currently be useful, to you, but I mention them, in case you add audio amplification, in the future.
I must use 2 stages of audio amplication, in an only partially effective effort, to counter an extremely high ambient noise level, caused by the multitude of un-muffled vehicles, that frequently use 2 nearby "rural" public roads, as a race track.
Otherwise, a single stage would be quite adequate.

I also replaced the previously used "stereo" type headphones (which use small speakers, as transducers), with a very old pair of Trimm headphones, that further reduced the low freq audio response, and thus, the hum level.

These steps caused a reduction of the hum to non issue levels. I can still hear some faint hum, under certain conditions, but it no longer a significant problem.

As an aside, I suggest adding a bypass capacitor, from the screen grid, of your 32 tube, to chassis ground.

Awesome that confirms my suspicion
in regards to interestage coupling.
I am having an issue with a 60Hz note FMing my CW
notes. It is was much worse when I was using a bench
supply for the filaments. I am running pure battery
power now, but I am still hearing it. I am thinking I
might have to encase the whole receiver to eliminate this
hum. Any suggestions?

I have had to make my throttle capacitor HUGE,
and it has limited functionality. I am thinking might
be asking too much to have one coil cover 80 and 40m.
 I am using an ARC5 coil for the tank. I had

thought to just use the screen grid voltage for a throttle.
 However, that would probably lower the AF volume while
reducing the regeneration. I might have to wait until
I put another audio stage before I do that. Thoughts
here?

Headphones: I looked into the Brush headphones,
and those appear to be a crystal set. My understanding
that the armature types are the most sensitive. An old
timer recommended Brands to me. However, I probably
won't need the sensitivity if I have an audio
stage.

I also saw a neat acoustic cavity filter in
August 1928 or 29 (I can't remember) for narrow CW
reception. I thought that was pretty neat.
Thanks for the Help,Chris KQ6UP

 Aren't most receivers from
               that period transformer coupled between
stages? Or
               slightly later choke and capacitor coupled.
 Those old
               tubes have a fairly low mu, so I am thinking
they needed
               the most efficient energy transfer. A
resistor and a

coupling cap is the cheapest and easiest for sure, but
just trying to stick to the spirit of the thing. Swapping
out the resistor for that it ignition coil boosted the
volume by about 50%. I had tried a whole range of
resistors. 5K was the best. I think I made a mistake on
the 900H bit. It is probably only 10H, but that still has
a fairly high impedance at 1kHz. About 60k from my quick
head calculation. The nice thing about the inductor is
that it allows the DC to flow to put the tube in its
highest transconductance range, but blocks out that audio
to pass along to the headphones or the next stage down the
chain. I am not an radio historian at this point, so you
guys feel free to correct me if I am wrong here.

Hi Chris, welcome to Glowbugs and the joy of playing with
retro-radio technology!

Typically a regen from the late 20's or early 30's would use
transformer or choke coupling between the regen detector and 1st
audio, although capacitor coupling with a resistor load in the regen
plate circuit was not unheard of either. If the regen detector was a
triode you would usually find xfmr coupling, and if a tetrode or
pentode, choke coupling. The reason is that the plate resistance of
a screen-grid regen detector is very high - hundreds of thousands of
ohms - and it was easier to realize a high-impedance plate load with
a large choke than with typically-available transformers. A resistor
for the plate load was not unheard of, though - the AC Pilot

Super-Wasp of (IIRC) 1929, mentioned here by Barry Williams, used a resistor in the plate load of its 227 triode detector. This is not as popular as using a resistor in the plate load of a screen-grid detector, because with the lower-Z of a triode a step-up audio transformer could be taken advantage of to increase the overall gain.

The National SW-3 used a National part that included a hi-L audio choke, coupling capacitor, and (IIRC) the grid load resistor for the audio tube; it used a tetrode or pentode as the detector (depending on vintage/model).

For your type 32 detector, you may want to try a 250K - 500K resistor as the plate load instead of the choke, and a higher plate supply voltage - preferably variable - to compensate for the voltage drop across the resistor.

In any case, a resistor for a plate load in a regen would not be "incorrect" for any regen of 1929 or later design.

When tubes were developed they did not understand grid bias. There is a small grid current that flows through that bias resistor, v=ir to get the bias voltage. Grid leaks are typically 1 to 10 megohms. In the early days the material used for the tube socket insulation might be in that range. One guy with a cheap socket might get great results with the insulator acting as the grid leak. Another guy might use a better quality socket and get poor results. That gave widely varying claims on the same design.

I have always been a National and Collins fan. The HRO is my favorite receiver among the older receivers. It is a good design from 1934. The AGS was predecessor to the HRO. Actually the first National superhet was the HFR. It was designed for 5 meters (60 MHz, the old VHF band). Millen liked to experiment with mechanical TV and VHF. I have something like 21 National receivers in the radio room and a dozen or more in storage. They range from the 1928 SW2 to the HRO500 from the late 1960s.

There are some beautiful receivers on the internet. I have a set of IF transformers and would like to build a replica of the superhet that Godley used for the transatlantic tests in 1927.

I heard that the guy at antique radio parts wants to retire, so you may want to check his parts out.

If you want to build a Wasp reproduction, I have most of the parts.

I've found that it helps to keep the audio input ;eads as short as posible. Also, putting the AF gain control in the last AF stage helps a lot. Another thing I've noticed is that some tubes are photo sensative. A 24A seemed to be picking up hum in one of my regens until I waved my hand over it. The hum reduced every time the shadow of my hand went over the tube. Thereafter I operated it in the dark.

Hello All,
During the past day I've received a few comments from those interested in some sort of net or on the air get together from like minded fellows. The comments are still coming in, which I'm glad to see.

If something got started, would those interested prefer a standard directed type net with a starting time, NCO, protocols etc or something a bit more informal like some of the 75M guys do with fast or frenetic paced break-in ops where you can join in or be on the side until every 10 minutes when someone ID's then everyone in the group follows suite? I operate both ways and there are pros and cons to both types of operations.

What flavor of net or on the air get together do you prefer? Directed and structured or non structured and frenetic paced break in? Either type can be a lot of fun if done right. I personally am involved in both.

Is there anyone from the Midwest or Canada who may be interested in doing something like this? What about the Western States when 20M is open? Just curious.

This may or may never come to fruition. We're only in the planning stages at the moment and entertaining some thoughts.

Your opinions will be most welcome.

Mod-U-lator,
Joe Cro N3IBX

From: Carl Nord
Topic: 12747 Message: 12747

Someone mentioned that they were building a pencil tube regen recently.

Is a copy of the schematic available?

Thanks

You might be on to something. The ceiling fan was causing the frequency to shift as the fan blades rotated and the shadow passed over the tube. I thought I was on acid or something because I could not see the wires moving. That could be the cause of the hum too, because they are cold lights (florescent bulbs). Their luminous flux changes at a 120Hz cycle.

For the record it is not an AM hum, it is an FM hum that is only present when the receiver is in the autodyne mode. Strong stations are fine because of receiver locking on to the carrier.

I am going to go sit in the dark with my receiver.

Thanks,
Chris KQ6UP

Don't know about that one, but just for fun a friend built a regen using an 833 tube. 10 volts at 10 amps for the filament sort of defeats the purpose, but a fair shack warmer. He sold it at a local auction for $100 as I remember.

I have used the brown pressboard (the name escapes me now) that comes in 4x8 sheets and about ¼ in thickness. One side is shiny and the other is a rough pattern. Cut it to size and give it a couple of coats of shiny black spray paint and it looks very much like Bakelite. It is also cheaper and easier to work with

Hi Chris and welcome to the list,

I have seen this material suggested for bakelite/hard rubber panels.

http://www.mcmaster.com/#catalog/116/3587/=qvgw8r

They may also have something you could use for coil forms.

On the fil. meter...I think the usual method was to use a voltmeter

with a rheostat. I built a one tube regen from 1935 using a 30 tube.

It works quite well.

Subject: [AWA] Hello (Introduction): One Tube Regen

Hello, my name is Chris callsign KQ6UP, and I am slowly putting together a late 20's early 30's vintage amateur radio station. I have built a one tube regen so far, but I need to start changing out parts to make it more authentic. So I have a few questions:

1. I am using the high tension side of an automotive ignition coil as an audio frequency choke, and taping my audio to a crystal radio earpiece. This is working VERY good. One tube setup almost needs no audio amplification. What could I replace it with that would be period correct, and where can I find one?

2. Where can I get sheets of black bakelite for the front panel? I have looked around, but I am not sure exactly what I should be looking for.

3. I am running a #32 tube, and I would like t have a meter to check the filament current. What would you recommend for period correct meter?

4. Suggestions for coil forms would be good too.

Here is my setup:

http://www.flickr.com/photos/81639412@N00/tags/regenerativereceiver/

Thanks,

Chris Maness KQ6UP

Well, sitting in the dark didn't fix the 60Hz FMing. It did stop the
wobble that corresponding to the ceiling fan shadows. And yes the fan was
still running.

Hi Carl!

I built a 0V2 regen (no RF stage ->pentode regen detector -> 2 stages of pentode audio) with subminiature tubes about 15 years ago. It's up on my shelf, I don't use it much. A D-cell lights the filaments (with a germanium PN junction in series to drop the voltage to what they want), and 5 x 9V batteries in series for the plate voltage. It drives a small speaker, but audio output is pretty PW. I should add a jack for phones.

I don't know if I ever drew up a schematic.

73,
-Larry/NE1S

Carl, like Larry, I also built a submini tube regen. See my Mk.19 in the Regenrx Photo section. The schematic in in the Regenrx 2 Files Section in the "leonardmeek" folder. It's also an 0-V-2, using 2 proximity fuze tubes and a 6088 submini pentode. The antenna is a ferrite loop stick and it tunes only the BC band. Have a look.

Thanks, Larry, nice looking receiver. I bought an early Wasp copy then found an original one with a Super Wasp. AC Super Wasp and Short Wave Converter. The last is the detector only, plugs into the detector of another receiver and uses its audio system.

I saw a homebuilt regen recently that had the grid leak and cap right at the tube cap. Of course the tube was in a tube shield also - remember those 2-part "Goat" brand clamshell shields? I think i also saw one where the whole grid leak right next to the tube grid cap was also inside a shield of some kind, something like a square of metal bent into a roll. Makes sense when you consider that with a grid resistor of 5 - 10M, the wire from the grid to the grid resistor is like a voltage probe for 60 Hz.
Running DC on the filaments helps too. Or balanced to ground heater wiring with maybe an adjustable balance pot.

Not related to your one-tube, but - maybe interesting. I posted something to the 'milsurplus' group some time back, something from a U.S. Navy maintenance manual, that said for their RAK-RAL regen receivers, some brands of 6D6 tubes hummed more, due to way filament was constructed - folded versus ? other way.
As i seem to recall, i think it pointed out one brand, RCA, as being superior to the other brand.

Yea, I have the grid leak at cap right at the grid cap. I probably need a shield in my shack, but that would hide the cool looking tube :(

It is all running on batteries at this point. It was worse when the filament was on a 2V DC supply, but the hum is still present running on batteries. I imagine I would need to shield it, or put up with the 60Hz FMing hum.

Thanks,

Why I prefer sailboats! sERIOUSLY, LISTENING TO A RECEIVER WHILE IN A COPPER SCREEN ROOM IS A VERY QUIET EXPERIENCE. Opps! Just woke up from nap. NOT shouting. Of course it is also boring as no rf gets in. That said, an outdoor ant and a room away from assorted electric stuff can make a big difference. Karl

That was funny! I had one, pretty rig and a challange re drift. Answer is leave it on always. Like an old Heath sig gen, gets stable eventually! Of course there are mods such as a diferential variable cap to 2 caps of opposite drift and slowly adjust until drift is stabilized too, but then it is not orig.

Which brings up a shadowy area for collectors vs operators/improvers: how much fixing is allowed beyond restoration. When a rig had been out for a few years, from the AT-1 to a TS440, it soon had a choice of a number of mods and improvements. The old QST AT1 mod that let the PA run straight through on all bands rather than doubling,and increased power to 35 watts on 80 and to around 15 on 10M. Overall it became a better rig all around; but was it still an AT-1??

I have 2 RALs but i am thinking i should sell both to allow me to keep some of the smaller sets. However, i found that Navy article very interesting. I never would have thought there was this difference in the tubes just due to filament construction. Just occurred to me now that maybe i should keep this in mind when i deal with my older HROs. When i come across the article again, or my post on it, maybe i will forward it here. Also interesting that the Navy radiomen would not just "put up with the hum" - they actually raised enough of an issue over it, that it made a Navy publication. The book this came out of was a collection of Navy maintenance notes about often experienced problems with radio and test equipment.

How do you spot on a regen? When I get anywhere near fo, and the receiver grabs on and zero beats (blocking). So I have no idea where I am, or if I am right on top of somebody. I am thinking folks in the golden years just lived with this bedlam, but I don't want to get a nasty gram from some angry ham.

Suggestions?

In the "golden years" many used xtal control and knew their
frequency. Some also used a "heterodyne detector" (a vfo with a
detector feeding earphones) In the forties these were refined by
the military as BC-221 and LM freq meters.
You tuned the VFO onto the rcvrs freq and then listened to the
detector as you tuned your TX to zero beat. They also
make a good sending monitor for CW operation. In one sense these
were the first "direct conversion" receivers.

Also, in those "golden years" contacts were not always on the same
freq. You called CQ and tuned around the band
for a reply, so not being able to zero in on your rcvr was not a problem

In today's Ham world, in order to be on the same freq, I use a BC-221
to swish onto my rcvr freq and then set my TNT to zero beat when
operating the OT QSO parties with my 1936 Sargent 11ua Regen, a real
West Coast classic.

Maybe the term "Golden Years" was misleading :D. The time period I am referring to is 1929 to 1932ish. Reading through some old QST's it appears 1929 was the year our 200m and down was consolidated into the bands we have now (more or less). Receivers and transmitters were still very primitive.

I sort of discovered the answer to my question by accident this morning. I don't have a 1929 era transmitter, but I have an equally frequency ambiguous Heathkit Apache.

When I use the spotting button, the signal is so strong the regen locks on over the whole audible passband, so there is no beat. Ironically, I can then hear all of the signals stable and clear with no 60cycle FMing modulation hum like I have been experiencing. The receiver at that point is zero beat with the transmitter, so if I hear someone in the 300Hz-1000Hz range I will move to another frequency as to not cause interference. I am not sure if that is how a two or three tube regen would have been used with a TNT or a Hartley back in the day.

I also have a MFJ regen that does the same thing. I have yet to make a CW contact with a regen. I made a AM contact the other day. It sounded so good. I am thinking that my farm style regen will have to be shielded and encased in a chassis in order to be of any use for a real QSO.

For the record I really enjoy making contacts with bare bones gear. I get the same thrill as working some rare DX. When I work DX with boat anchor stuff, I get twice the thrill :D

Carl, like Larry, I also built a submini tube regen. See my Mk.19 in the Regenrx Photo section. The schematic in in the Regenrx 2 Files Section in the "leonardmeek" folder. It's also an 0-V-2, using 2 proximity fuze tubes and a 6088 submini pentode. The antenna is a ferrite loop stick and it tunes only the BC band. Have a look.

Hi Carl!

I built a 0V2 regen (no RF stage ->pentode regen detector -> 2 stages of pentode audio) with subminiature tubes about 15 years ago. It's up on my shelf, I don't use it much. A D-cell lights the filaments (with a germanium PN junction in series to drop the voltage to

what they want), and 5 x 9V batteries in series for the plate voltage. It drives a small speaker, but audio output is pretty PW. I should add a jack for phones.

I don't know if I ever drew up a schematic.

Thanks, Barry. I'm going to be building another 0V2 for myself, using similar construction with a bakelite panel and chassis - not trying to imitate any particular design. I have all the parts, but not the time. Several other projects in front of it!

Funny you should mention the short wave converter. Last week's mini-project was to play with a Stewart-Warner model 301 short wave converter I had purchased at the Conference flea market back in (IIRC) 2009. Normally it wouldn't take me that long to get around to working on a new purchase, but, for some reason this time it did. The converter uses a 227 local oscillator and 224 mixer to feed the antenna connection of a BCB radio. I had to replace the rubber in the friction-drive tuning mechanism, and wire in a replacement for a 1uF 400V decoupling condenser, which was a canned unit that had gone leaky and was pulling down the plate supply so low that the local oscillator wouldn't work at all on the higher-frequency band (there are two bands - one that covers approximately 1.5 MHz to 4.0 MHz and another that goes up to 10 MHz or so). There is no HV supply in the unit, since it borrows HV from the "host" BCB set. So there are no failure-prone HV supply components, such as filter condensers, to worry about. Working now, except the oscillator still quits at the lower-frequency end of the higher frequency band, where the amount of feedback is the least - a common problem I have run into on several old superhet sets which could be a weak tube or something more subtle. Still need to look into that problem. The converter is hooked up to and sits atop a 1929 Lyric (All American Mohawk Corporation) TRF console in my dining room. When the converter is turned off a switch (ganged with the power and band switches) connects the antenna directly to the console set which therefore functions normally on the BCB.

One way it was done in the old days was with a "growler", or monitor, which was nothing more than a simple regen set - single tube in most cases - without an antenna, which was well shielded so that it could hear the local transmitter without blocking but put out a strong enough signal to be able to hear it in the regen. A "third party," if you will. I use a "modern" LM-5 surplus frequency meter for the purpose.

The 5702 and 5703 have 6.3V, 200mA heaters. We used them mostly in anti submarine equipment. The tubes I used in my Mk.19 are Sylvania 1268's (?) I can't find any data on them but the filaments seem to work on 0.75V @ 10mA.

I realize it's bad form to reply to one's own post, but I wanted to add that if anyone has any documentation on this unit beyond just the schematic that would cover operation, frequency coverage, etc., I'd greatly appreciate scanned images of it. I DO have a schematic; I found it in the back of Lindsay's reprint of Gernsback's 1934 Official Short Wave Manual.

Hi Karl,
The main drift related problem that I had, with a 753, could not be eliminated by the use of a differential cap, or by keeping the xcvr turned on 24/7.
The VFO freq was affected rather significantly, by any fluctuation, in the vfo tube heater voltage. The vfo design was poor, which greatly increased the amplitude of the problem (low "C" resonant circuit, a low Q slug tuned inductor, etc.).
The heater power was derived from the same power xfmr that supplied the B+, which of course included the high voltage to the PA stage.
When a transmission was made, the increased load on the xfmr, caused the heater voltage to drop, noticeably, causing the vfo freq to begin a drift "voyage". At the end of the transmission, the vfo would drift back toward where it was, before the transmission was made.

Any fluctuation, in the line voltage, would also cause the vfo to wander about.
A cure was easily accomplished, by regulating the vfo tube's heater supply voltage.

That was funny! I had one, pretty rig and a challange re drift. Answer is leave it on always. Like an old Heath sig gen, gets stable eventually! Of course there are mods such as a diferential variable cap to 2 caps of opposite drift and slowly adjust until drift is stabilized too, but then it is not orig.

Which brings up a shadowy area for collectors vs operators/improvers: how much fixing is allowed beyond restoration. When a rig had been out for a few years, from the AT-1 to a TS440, it soon had a choice of a number of mods and improvements. The old QST AT1 mod that let the PA run straight through on all bands rather than doubling,and increased power to 35 watts on 80 and to around 15 on 10M. Overall it became a better rig all around; but was it still an AT-1??

I believe it had more to do with crystals than anything. Lew McCoy made a great rig with about 5 or 6 dB more out and it was clean. I believe the QST was from the late 1950's (anyone know???) but they - my QST's are in MO and I am in Florida. And yes, the osc doubled above 80 or 40 in this mod and tripled for 15 but not sure. It was long ago. Karl

Hi agn Hue.
The 751 power transformer has a center tap, on the HV secondary winding.
It would be easy to convert the bridge rectifier to simple full wave rectification, which would yield ~ 380 volts (choke input), or ~ 450 volts with a cap input filter.
I hope this helps.

Carl, the pics are in Regenrx, but the schematics are in Regenrx "2" Files, in the "leonardmeek" folder. There you will find a bunch of my other stuff. I don't know if you need a separate membership to get in there, but there shouldn't be any problem signing up if you do.

Hi Leonard,

I found the pics, but cannot find the file!. Great looking rig. Can you send me the schematic please?

Thanks

□

Carl, like Larry, I also built a submini tube regen. See my Mk.19 in the Regenrx Photo section. The schematic in in the Regenrx 2 Files Section in the "leonardmeek" folder. It's also an 0-V-2, using 2 proximity fuze tubes and a 6088 submini pentode. The antenna is a ferrite loop stick and it tunes only the BC band. Have a look.

Is a copy of the schematic available?

Thanks

Hi Carl!

I built a 0V2 regen (no RF stage ->pentode regen detector -> 2 stages of pentode audio) with subminiature tubes about 15 years ago. It's up on my shelf, I don't use it much. A D-cell lights the filaments (with a germanium PN junction in series to drop the voltage to what they want), and 5 x 9V batteries in series for the plate voltage. It drives a small speaker, but audio output is pretty PW. I should add a jack for phones.

I don't know if I ever drew up a schematic.

12802. Documenting vintage radio batteries...

Yahoo group: antiquewirelessassociation (2010 — 2015)

From: <kd4hsh@...>
Topic: 12802 Message: 12802

Folks,
Like a number of folks, I have been working to document and replicate vintage radio batteries. Because they were disposable, there are many batteries for which there is no longer enough information AVAILABLE to create accurate replicas. Very few examples from the 1920s & early 1930s still exist in collections and may be the only remaining, reliable source of information on how they were made.

I've given some thought as to what is necessary to document batteries and propose some instructions for doing so. I have a few preliminary web pages and would welcome comments on how to improve them.

The first two pages are on how to document your battery.
http://kd4hsh.homestead.com/Battery-Art-00.html
http://kd4hsh.homestead.com/Battery-Art-00.html

Then there is an index page for battery information on my site.
http://kd4hsh.homestead.com/Battery-Art-index.html
http://kd4hsh.homestead.com/Battery-Art-index.html

Thanks,
Robert

I am loosely basing my receiver on this design:
http://www.w7ekb.com/glowbugs/rx/Regens/KW7WT_2.gif

I noticed that I had grounded the negative side of the filament. After reading a data sheet for the #30, it suggested that the grid return be connected to the positive side of the filament. I am using a #32, and noticed my schematic called for the A+ be hooked to ground. In my mind this would reduce the grid bias, but put the cathode slightly below ground potential.

The effect was to make the set louder, but I lost my smooth regen throttle. It now snaps into oscillation, and there is bad hysteresis for the regen throttle. I appreciate the gain in sensitivity, but it makes the radio more difficult to use. The reason the #32 was chosen is that it is a low mu tube that provides smooth regen control.

I can now hear 80m CW. The funny thing is -- I am not hearing the FMing hum at the lower frequency range.

I am curious why the original design has such a low C tank. It also has a very high grid leak and small grid cap.

Any comments -- suggestions?

12804. Delrin for Panels

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-03-07 04:40:58 UTC
From: Barry Williams
Topic: 12804 Message: 12804

I had some 1/4" thick Delrin that inspired me to believe that 3/32" material to be perfect for panels and chassis for older radio construction. I ordered a 12" x 72" x 3/32" sheet from McMaster Carr ($77.50). Unfortunately to save on shipping they rolled it up in about a 20" circle for shipping.

I have it flat with weight on it, but thought I would see if anyone has any idea about straightening it. I think heat will be required.

If it were flat, it would seem ideal. It is pretty stiff, looks like black Bakelite and is easy to work, no problem to drill, bore, or mill. The 12" width would be good for two to four tube receivers. For something like a Wasp you could get about 5 sets of chassis and front panel. That would be only $15.50 each pair.

73,
Barry

Hi Chris,

Intuitively, I believe that your initial connection was correct. IMHO, the data sheet suggestion would result in a positive control grid bias, which is not usually desirable. The results that you observed, would certainly seem to confirm that your initial connection was correct.
I hope to do some further research, on that subject, but I am unable to do so, now, thanks to the impact of a #%& ice storm.

The excellent old QST article (I wish that I could remember its name!), that I have referred to previously, included the results of some experiments that included varying the LC ratio, in the detector tank circuit.
The author explained that a low C circuit offers a higher resonant impedance, compared to a low C circuit (assuming that the Q of the tank circuit components is maintained). The higher impedance allows a greater voltage to be delivered to the detector grid, for a given input signal voltage.
I am not able to remember the claimed advantage of a small grid leak cap, Chris, but I had used a smaller size cap (39 pf?), when I constructed my regen, several years ago.
However, I replaced the 39 pf cap, with a 100 pf unit, when my recent experiments yielded a noticeable improvement in sensitivity, when the larger cap was used.

From: Chris Maness
Topic: 12724 Message: 12807

Yes, I think using too small of a grid cap causes a higher grid bias. You were probably shutting the tube off. Here is my explanation of what is going on:

"I figured that. In my mind I see this detector design as self clamping. Since the grid to plate circuit is a diode of sorts, the grid leak cap charges when the tank return is more negative than ground in its cycle. There for it is only charging on the peaks of oscillations because that cap maintains a DC charge. The grid leak resistor sets the voltage by limiting how quickly that cap discharges. This is how I see it as self regulating. The stronger the oscillations the tank, the more negative the control grid becomes. Therefore, the smaller the cap/larger the resistor the more negative the CG becomes."

Maybe the author of the original design had the small cap (12pf) and 22Meg resistor to compensate for how he wired the filament.

Thanks,
Chris Maness

From: <kd4hsh@...>
Topic: 12804 Message: 12808

I'm sure that Delrin has no relation whatever to old hard rubber but I'll bet the same thing will work.
I see your sheet is pretty long so you might have to make a kluge trough from poly & 2x4's - make sure the poly is not in contact with something that will suck heat...
Fill the trough with a couple of gallons of near boiling water (don't skimp on volume)... you need thermal mass... and submerge the panel. It should relax.

Robert

Oh...
My part of the country is low on heat and sunshine at the moment so I forgot to mention that baking in full sun for several hours should do it... Use the 2x4s and poly to act as a solar collector... Surface temp could get to 150 F+.
Robert

From: Barry Williams
Topic: 12804 Message: 12810

Thanks Robert. I did a quick look and found that Delrin can be used in life locations up to 180F. The melting temperature is up at 330F. One other value given showed distortion with pressure at 260F. I am thinking about cutting to size and putting it in the oven. I just need to find two flat plates that will be OK at 300F. My local friendly machine shop may have a couple of steel plates I could borrow. One project is a home-brew copy of a National SW4. It was built on used Bakelite panels with extra holes. It has a few changes, the dial and tuning cap are substitutes. I have correct parts, so it would be an exact SW4 except for the delrin chassis and front panel.

I also ordered a 12" x 24" x .093" piece of delrin and requested it to be shipped flat.

From: Larry Szendrei
Topic: 12811 Message: 12811

I'm looking for the cabinet and covers for a Command Set transmitter, because it is the right size and shape for a planned project.

I don't need any of the internal parts, and as long as the chassis aprons and covers are in reasonable shape without any extra large ugly holes it will serve my purpose. Large ugly extra holes on the front of the XMTR or top of chassis are OK because I will be fabricating new plates that will cover these surfaces. Either the ARC-5 or BC- series of transmitters are OK. The Command Set receivers are too small for this project.

Someone out there must have a well-hacked, beyond-restoration unit in their junque box.

Will trade for parts or tubes of approximate equal value (preferred - I have a well-stocked junquebox), or am willing to pay $10 plus postage for a unit meeting the above description.

Please reply directly (not through the lists).

73,
-Larry/NE1S

12822. My One Tube Regen: Room for Improvement

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-03-17 03:31:57 UTC
From: Chris Maness
Topic: 12822 Message: 12822

Made my first contact today with my one tube regenerative receiver. It happened to be 40m AM. CW and SSB is still a little squirrely (although not on 80m -- it is actually usable there). I have made some vast improvements in sensitivity.

I see clearly that it is a trade off between having a good impedance match and tight coupling from the antenna and the tank circuit, and keeping the tank Q high enough to get good gain. I imagine this problem could be cured by a one tube RF stage. However, I understand that this would have to be tuned by either a TRF stage in front of the regen detector with a separate knob or a gang capacitor.

If I couple the antenna for maximum response to the headphones, I can't use my transmitter, but the one tube regen produces ROBUST audio in my crystal earpiece. If I couple the antenna to my transmitter, I have to STRAIN to make out anything. Is there a way to overcome this problem without adding an RF stage in front of my receiver? Currently I am using an Apache for a transmitter looking for a 50ohm load, but I hope to build a simple one tube transmitter to match my receiver when I get 'er all dialed in.

Not clear, but sounds like you’re using an antenna tuner and trying to find settings compatible
for both. Or?

You could possibly use a short wire antenna for receive alone, and couple it thru a small pF
variable condenser to the top of the receiver tuned circuit. A shorter receive antenna would
not dump a lower impedance load onto the tuned circuit
Or - the regenrx yahoo group I’m sure has posted on its site, schematics for circuits with an
untuned grounded grid RF stage whose purpose is not gain, but to isolate the antenna from the precious single tuned circuit. In some circuits, that grounded grid RF stage also does double duty as an audio stage. It can do both without trouble.
I take your success with the single tube receiver as an inspiration to me. I always wondered
whether the ARRL Novice book single 3S4 receiver could actually be used to communicate.

Chris,

The SW4 (next Journal) used an unturned RF stage. The Pilot Super Wasp used a separately tuned RF stage, the SW5 used a gang tuned RF stage and detector. You may want to look at the schematics on Bama (National on SW4 and SW5). Easiest would be to add a stage of audio amplification. The main problem with the regenerative detector is lack of selectivity. The tuned RF stage helps a little. If you have old QSTs I believe the last quarter of 1927 had an article about RF amplification with the triode. In December of that year the new 222 screen grid tetrode was introduced which worked much better as an RF amplifier. There are several articles in that December issue about how to use the new tube. Interstage audio transformers are still being produced.

Forgot to mention, I use a 4:1 balun between my antenna distribution panel and the older receivers (FBXA, AC Super Wasp, AGS, and HRO). I believe Al Klase put an article on the internet about his SWL distribution system. It has core and winding information. I use his splitter and balun. I built the baluns in small aluminum boxes with 5 way binding posts on one end and a BNC connector on the other. I use BNC connectors for the patch panel and receivers and UHF for transmitters (PL-259) and transceivers. That way it is harder to transmit through the 8 channel distribution amplifier.

73,
Barry

Thanks guys. I think I am just going to add an RF stage. I have enough output on the stronger stations to drive my earphones to full volume. I might not even add an audio stage. The RF stage should do a good job of handling the relatively lowZ input and match it to the Crazy HighZ tank.

Hi Chris,

Like Hue, I was uncertain that I understood what adjustments you were making, that allowed either your transmitter OR your receiver to function well, but not both. Are you indeed referring to the use of an antenna tuner???

Most of practical experience, with the use, and experimentation with a regen rx, occurred a few months ago. I wished to use such a receiver, in the AWA BK QSO party, last December. My previous experiences, with such a receiver, occurred many decades ago, and my memory is far too poor, to allow me to remember the details, of those experiences!

During my recent experiments, I initially used a short indoor antenna, a tactic that frequently seems to be recommended.
I experienced hum problems, which prompted me to try using my (50 ohm) coax fed, full size outdoor dipole (my transmit antenna).
The results were very favorable. The hum problems vanished and in addition, the receiver sensitivity improved. I tuned in several very weak signals, on a comparison superhet rx (on 80m & 40m), and found that I could copy literally any CW signal, on the regen, that I could copy, on the superhet (except under the most extreme QRM situations-such as FSK digital QRM).

I am using simple capacitance coupling between the "hot" side of the resonant tank coil, and the antenna input terminal. In my admittedly limited experience, the coupling did not seem to be at all critical. I had to use more regeneration, when the coupling was increased. The sensitivity suffered, when extremely "loose" coupling was used, but the coupling was apparently not at all critical.
Due to space limitations, I am using a gimmick cap, consisting of 2 pieces of hook up wire, twisted together. This admittedly is not as convenient to adjust as a shaft type variable cap, so my experimentation has been somewhat limited, as a result.

If you are using an antenna tuner, Chris, my suggestion is to adjust the antenna tuner, for optimum power transfer, with the transmitter. Then adjust ONLY the input coupling, on the regen detector, for optimum results, on receive.

The one problem, that I did encounter, occurred on 160m. I was using my 80m dipole, as the receive
antenna, as a convenience matter. (This was a "quick & dirty" lash-up, and no time was available, to arrange a switching arrangement to switch my 160m dipole between the transmitter and receiver).

I noticed that I was hearing many CW signals, BELOW 1800 Khz! I soon learned that I was hearing 80m signals, as a result of the second harmonic of the oscillating detector, hetrodyning with the incoming 80m signals.
The strength of the 80m signals, from the resonant 80m dipole, was so great, that they were able to overwhelm the selectivity, of the resonant tank circuit, of the detector!

As a result, in the future, I plan to use only an antenna, that is resonant on the band that is currently in use, with my regen rx.
Note that a tuned RF stage, would reduce such a response, but an untuned RF stage woud not.

I hope that some of this is useful, Chris.

Indeed, I am using a tuner, but the adjustment I make going from being a better receive antenna to a transmit antenna is to take the transmatch out of line for the RX. However, I don't feel like throwing that switch as well every time I go from TX to RX. I have made a compromise by going from a semi loose inductive coupling (loudest audio) to a gimmick capacitor. This is the loudest I can get it with the transmatch in line. If I add a stage, I can go back to loose inductive coupling and have my cake and eat it too. That first stage should be able to accept a low Z load (~ 50ohms). It would be some advantage in this scenario because the first stage would have a lower Q, and it would have a less critical adjustment which in my mind is good (Iess fidgeting is good).

That is because receiver sensitivity is not the limit on the low band. The noise floor is. If you can here the noise floor, you can hear all but the

weakest stations that (with exception to those only a narrow ~500Hz filter will pull out of the mud) a $5000 superhet will hear.

This would not be the case on 15m/10m.

Yes there is a trade-off between coupling. The more capacitance the more the tank sees the antenna Z. Some of that is real resistance. In a perfect antenna that would radiation resistance only -- real world would be ohmic resistance + radiation resistance. This can kills the Q but passes more signal. The Q can be so low it is hard to get the regen to cycle enough times to get any real amplification.

That is exactly what I am doing, but it is not optimal (see above).

Ron's info and advice is very good.
I noted that on an early 1930s "short wave adapter" i have, which is basically just a single
triode detector, the coil, which is built on a linear format plugin assembly, has an antenna
winding which is adjustable. It pivots at one side, so it can vary from max coupling, fully in step with the main winding, to 90 degrees offset, for minimum coupling. It isn't front panel adjustable, but that would be one more possible improvement.

I can have my cake and eat it too. Added many more turns to the any pickup coil did the trick. Now, I am hearing very well when the transmatch is in line. I am actually thinking the signal was capacitively coupled to the tank coil more than it was inductively coupled. My transmatch is floating because I am running a balanced antenna, and I don't have RF in the shack problems so long as I stay on the frequencies my antenna was designed for. Adding more turns seems to do a better job of getting the RF to the tank. I might have to back the coil off a little further, but the RX signal is happier seeing that larger L at the end -- and this makes sense to me.

I now have made my first CW contact with a ONE tube receiver. I used my Heathkit Apache for the TX. I will have to try my Conar 400 as it is a One tube transmitter. It is pretty awesome to make contacts with such primitive gear. A two tube QSO would be a kick in the pants! It might be fun to try a one tube QSO.

I have uploaded a photo of my RX.

Okay, I searched in Google for spark transmitter and found boxes like the ones my friend has. As you said it appears to be a spark coil for a spark transmitter. My friend has five of them that will be in the auction at the AWA convention. He also has what looks like a complete spark transmitter and an extra motor drive with a spinning spark gap attached to it. And a number of other old items.

See you at the convention.

Subject: Re: [AWA] What is this box?

That is a spark coil box for old spark gap radio. The upper terminals are the primary connection and the one on the front should be the high voltage secondary.

Tom, Sorry I will not be there to see them. Sounds like a good setup.

Most of my really early stuff starts in lates 20's, most in 40's on.
But always pined for a small spark set. Just have to build one now.
Have a lot of old keys that would look good next to it.

Have fun for me

Yep. That's what it is, all right. It looks very similar, if not identical, to one I have that was my grandfathers, and that one still works. He used it as ARS 2BSQ back in the day. The tag on the side says "THE WIRELESS EQUIPMENT CO Inc. NEW YORK U.S.A." I have attached a few images.

Correction to the post below: the terminals on the front are the primary circuit, and the ones on top are the HV secondary.

Except for the fancy woodwork, it looks like the Model T Ford spark coils I have. We used to use them in our error recorders back in the old days.

Yesterday, I made my first QSO using a one tube regen. I do have a Conar 400 which is a one tube transmitter. I am going to have to give a go this afternoon before the band becomes too crowded. That was quite a challenge. Now it wouldn't be too hard, but it is all the minor tweaks that add up to a radio that works well enough for the task. I am going to have to build another one tube radio, because this one is now a two tube receiver. I added an audio stage yesterday when I got my 90 year old audio transformers in the mail.

I am having too much fun :D

(Hi Carl!)

Too modern - use a type 19, or a 53 if you must have a dual triode ;-)

OTH, 6SN7 pulls are plentifu,l as long as they're not of the
audiophoole-select variety.

It is now a two tuber. Insanely sensitive for such a simple design. I tried to work some DX on 40m CW with it. No joy yet, but it should not be too long.

See attached picture.

Larry - can you recommend the best 'unmodern' equivalent for the 6SK7? I'd love to do the Paraset receiver in vintage style. Using the 6SK7's it is a superb regen...an equal to the SW-3 in all respects.

The later WW2 HRO used metal tubes, 6k7 and 6j7. Preceding that were glass tubes. 2.5 volt 57, 58. 6v 6c6, 6d6. The glass tubes date from about 1933.

In other words, do you consider a one tube receiver a single tube with just one cathode, grid, and plate? Or would you prefer a design that included another tube amplifier in the same glass tube? IE 6SN7 dual triode, I would not consider this a true single tube receiver, but opinions may vary.

There is a picture of an early operator who had a long wooden rod screwed to the tuning knob. Reduced hand capacity and gave a huge mechanical advantage.

Hi Steve,

I think Barry has already answered this, but here are some equivalents, or nearly so, in order if icreasing age: 6K7, 6D6, 78, 58 (all 6.3V heaters except for the 58, which is 2.5V).

Equal to the SW-3? That's saying something! The only HF regen I know that is better than the SW-3 is the RAL, but there may be others I haven't played with. Yet.

73,
-Larry/NE1S

Larry,

Years ago I built a couple of direct conversion solid state receivers. I was pretty impressed by how clean they were. I have thought about building a direct conversion tube receiver. Something like a 58 ECO and 57 mixer followed by one step of audio, probably a 56. I don't recall any receivers built like that. I guess that is one step skipped in the evolution.

I have series 1 and series 2 SW3s, but never found a series 3 octal tube unit. The SW58 is pretty much a series 1 SW3 with push pull audio stage and FB7 type dial, I like it quite a bit.

For non ham listening, I still enjoy the AC Super Wasp. Someone mentioned a single tube shortwave converter. I have one from Pilot. It is the regenerative detector from the Wasp. It plugs in place of the detector in another receiver. Its detector is a 224A.

Concerning a one tube bread board receiver, I would look at the Pilot Wasp information. Forms for coils and winding instructions are available. Also someone mentioned Ford Spark Coils. These make good audio chokes for inductance coupled audio stages.

Ernie,

Check the bottom of my post. I would recommend building the detector of the Pilot Wasp. Coil information is available. It used a 24A tube. You need the coupling cap 100 pf fixed, a grid leak resistor which can be 5 to 10 meg, tuning capacitor and regent throttling capacitor, coil and sockets. An audio coupling transformer for hi z phones, this keeps B+ off your head and strengthens the audio. If you are wanting just any regent, the idea of the dual triode in one tube the 6SN7 is a good choice as someone else mentioned. If you want details about the Pilot Wasp I wrote an article a few years ago in the Journal about it.

Let us know what you want.

73 and Good Luck,
Barry

There's plenty of schematics around for all kinds of regens. I've collected many of them from the internet. You'll find the the circuits are not at all critical, and they're all basically the same. The question is, what tubes do you have available? Also, will you use a bench power supply or batteries? Also, what method of feedback will you use?

Leonard

I would question the 70,000 ohm speaker. The S-101? Impedance coupler used in the SW-3 put the inductor, coupling cap and grid leak in a metal can. I saw something that indicated the inductance at 1,000 H. A better reference was one project that called for the National coupler, but offered as suitable substitute a 500 H choke. I have seen other similar circuits that say tie the primary and secondary of an audio transformer together and use that.

Most small regens feed audio direct to phones. Good phones were about 2,000 ohms. There was a small flap in which one company offered 2,000 ohm phones that were partially wound with resistance wire. They were cheap. I have 2,000 ohm "Baldies" but they are not very comfortable. Sometimes I cheat with an audio output transformer and modern headphones.

The regens I am most familiar with used a primary, secondary, and tickler windings on the coils.

The 750H is probably correct. The 70,000 Ohm speaker sounds off the wall.
Maybe electrostatic or crystal headphones.

There is another rotten Easter egg in there.

Yes, the used to use these because they maximized the possible power gain
in an interstage transfer. After the prices of tubes dropped, and the mu
increased they switch to R/C interstage coupling.

Chris KQ6UP

The challenge still stands :D

Ahh, yes now I see it, Barry. You found another typo. You were referring
to the tank and tickler. There is still another big mistake in there :D

You have to consider a “single tube receiver” means just a single plug-in tube device, regardless of number of sections included in that tube. There was a single-tube regen receiver circuit, first seen in Popular Electronics many years back, which used a 3 section single compactron tube. It was honestly a single-tube receiver. There is a radio builder website that has a DX competition and their rules avoid the ambiguity by specifying it’s a “1 A.D.” receiver contest: “one active device”, whether for example, a single pentode or a single transistor. To set yours apart, you’d have to call it a “single triode receiver”, which makes it absolutely clear.
In the old-time terminology, which seems to have faded away here with the 1920s, compared to Europe, where the term continued to be understood thru the tube era (I believe this is so), your circuit would be called a “0-v-0 circuit”: no rf stage, then detector, followed by no audio stages. So anyone who saw your 0-v-0 description, say on a QSL, would instantly know what level of receiver you were using.
I think that’s true.
Any corrections?
-Hue Miller

Good point. So the ultimate OT contact would be spark> Xtal detector and back? Not a shot at the current contest which I love. Just a thought

There would have to be special category for spark contest. Possibly, points are subtracted for each
contact.
I have an Erektor-set company, boy’s spark buzzer transmitter with single untuned crystal diode
receiver. The instructions say with a decent antenna, you can reach to two or three houses away.
So it’s hard to compete in any contest with that.
Another special category could be “totally self powered”. Like, use Michael Rainey’s voice-powered
transmitter together with a crystal radio receiver.
Now to tune back into reality....

Chris,

Are we talking about the 1st (top) or 2nd schematic - i.e., the 2-tube or 3-tube RCVR?

The only error I can find in the top schematic is the antenna connected directly to the top of the grid coil, which would only work for a short whip. The coupling would be much too tight for any "real" antenna - a small value capacitor would need to be placed in series, or "light" inductive coupling used.

But I don't think that's what you are talking about.

I didn't study the 2nd circuit as closely, but it too looks fine at first glance.

It's the first schematic. There is another error besides the F/F-/B+
issue.

I got it for a price so low at the auction, I'm going to be picking up the sellers lunch tabs for some time to come. It has no tubes and I'd like to fill it up with a regional brand of 01-A. Got any knowledge of what would have been a common brand name tube in Portland with a regional flavor? (Display only tubes are fine with me.)

That is a cool website. I think I have stumbled on it before. Too bad
they don't sell stuff like this today. I teach Chemistry and Physics, and
the kids are always asking when are we going to blow something up.

I have to tell them "we are not, it is illegal" :D

Hi Leonard,

I don't think that is an error. The author is referring to the four pins of the coil form as F+, P, G, and F-, corresponding to pin numbers 1, 2, 3, and 4, respectively. That was one convention for a 4-pin base, "back in the day."

Aside from the F- on the tickler, F+ on the ground end of the tank, the 70000 ohm speaker, and the "C" voltage is only shown as -13V at the switch, it looks like a perfectly good circuit. But then, maybe that's why my circuits don't work.

Leonard

Chris KQ6UP

Chris,

Are we talking about the 1st (top) or 2nd schematic - i.e., the 2-tube or 3-tube RCVR?

The only error I can find in the top schematic is the antenna connected directly to the top of the grid coil, which would only work for a short whip. The coupling would be much too tight for any "real" antenna - a small value capacitor would need to be placed in series, or "light" inductive coupling used.

But I don't think that's what you are talking about.

I didn't study the 2nd circuit as closely, but it too looks fine at first glance.

73,
-Larry/NE1S

Hi Leonard,

I don't think that is an error. The author is referring to the four pins of the coil form as F+, P, G, and F-, corresponding to pin numbers 1, 2, 3, and 4, respectively. That was one convention for a 4-pin base, "back in the day."

From: Ludwell Sibley
Topic: 12890 Message: 12899

"Meier & Frank," sold by the big department store of that name in Portland, is the most appropriate local brand. It has been on the "201-A Brands" list forever, including the latest version by Hal Kravig ("Tube Collector," June 2012). It's sufficiently rare as no to appear in the Fathauer "Boxes" book. Bob Deuel and I each have a tube or two (of a more modern type than an 01-A) under this brand.

This is the western analog of tubes sold under the Bamberger's or Hochschild Kohn & Co. or R. H. Macy & Co. brands back East.

There are some "Kilbourne & Clark" - branded tubes around, but that was more of a Seattle operation.

Knock yourself out!

Ludwell Sibley

12900. JFET Hartley Transmitter?

Yahoo group: antiquewirelessassociation (2010 — 2015)

From: Chris Maness
Topic: 12900 Message: 12900

I was thinking of building a Hartley Transmitter with a Jfet to go along with my two tube transmitter. I would build a tube transmitter, but my hobby resources are near dry. Also, I have a five year old in the house that I don't want to get across the tank coil. I will settle for a JFET version for now. Have any of you guys built one of these?

Thanks,

Chris KQ6UP

The grid winding of the grid coil is labelled "Pri.?"

I already mentioned connecting the antenna directly to the top of the
grid winding is a bad idea. and will result in over-coupling to the
antenna(unless the antenna is a very short one).

I think that has to do with most transformers being labeled in the method
back then. My interstage audio transformers are labeled that way.

It is true, my regen stops working altogether when the antenna us hooked
directly to the tank. Even a gimmick is too much. I either have to
inductively couple it, or just bring the antenna lead within an inch or so.
However, I have a crazy grid leak. 22Meg and 12pufs. It makes the radio
very sensitive with better Q, but it is super easy to kill regeneration
with this setup.

The mystery mistake is still in that first schematic. I don't want to give
it away unless all you guys quit :D

Haha, I am going to do it regardless of the Juju. Same technology as a N-chanel JFET is a very close analog to the triode. It will be a breadboard just like my receiver. It is cheap, and get me on the air for now. It is safer for little people too.

I am just trying to walk in the shoes of my RF ancestors, not have a period correct piece at this moment. I just want to have the experience. More accurate reproductions will come later :D

Shoot, it is tough to get most hams my age to do anything but by a Boufung off of ebay.

Just yankin' yer chain, there, Chris! ;-) I use JFETs occasionally, but never used one in a regen. I used some in a (reversible) solid-state conversion of an 80M ARC-5 receiver (so I could run in off 12V in the car), and also a similar conversion to a Gonset Triband converter. Also they are useful as source-followers to drive low-Z loads from vacuum-tube grid circuits. But I never built a regen with one.

Nope. In this schematic the suppressor grid is omitted in the symbol for the '33 tube, as the connection is internal. That way of drawing the screen grid - two grids tied together surrounding the control grid - was common back in the late twenties and early thirties. The suppressor, if shown, would then be indicated by a pair of grids connected together surrounding the plate.

For examples I pulled my Lindsay reprint of the 1934 Official Short Wave Manual off the shelf and the first page which opened (randomly) had the attached circuit. Note the representations for the 58, 57, and 2A5. Also note that the grid for the 58 has an arrow on it, apparently indicating its remote-cutoff characteristic vs. the 57.

That is indeed odd. I do think its strange that my '32 has the SG on the outside of the plate as well. I would imagine the space charge is very close to nil out there. Is it supposed to be there to help shield the plate?

As far as the '33 goes, it did cross my mind that the suppressor grid was omitted due to it being internally connected. However, I had never seen the CG have another element in between it and the cathode. What was the rational?

Thanks, learn something new every day.

p.s. I am going to assume the '33 speaker load is wrong by 1/10. The data sheet specifies 7k for lowest THD.

All in all, this looks like an interesting circuit. My regen is very close, but the audio gain on this one would probably drive a small speaker with the appropriate matching xformer. I am using a '32 and a '30. The radio brings the 40m noise floor right up to comfortable (maybe even a bit loud) level. Last night I heard an F5 on CW calling CQ, and the other night someone from high latitude EU calling CQ. I missed the call, but I heard the familiar phase distortion from traveling over the N pole.

I am now making daily CW contacts with it. I have designed a solid state Hartley to go along with it (I know blasphemy). However, the underlying technology is the same.

From: Chris Maness
Topic: 12921 Message: 12921

Anyone know where to get the connector that goes on the 45V battery for telco breakdown sets? I have been using one of these batteries for my radio, and I am using toothpicks to keep the wires in place. I noticed one of the photos in the gallery had one of those batteries with the proper connector.

Thanks,
Chris KQ6UP

That's what I always surmised. Might reduce or eliminate the need to use a metal shield over the tube in some instances, since the screen grid is almost always at signal ground.
>

> What was the rational?
Maybe in the early days of tetrodes, before pentodes came along, they drew the screen grid "around" the plate because it sometimes was physically arranged that way. Then when pentodes came along, perhaps they just moved the screen symbol around the control grid so that they could add the suppressor grid to the schematic representation, and it seized to accurately represent the physical situation at that point. Admittedly all SWAGS on my part, though.

Maybe Lud can add some insight, and chime in?

Kinda like using a bull dozer to push a pebble, but it should work.
There is a design "out there" which uses a 1625, which electrically
(except for heater voltage & current) is essentially a 6L6. I think it
used the 12VDC heater supply for the "HV" supply as well.

For a more conventional design I'd use a common tetode or pentode like a
6SK7. But if you are going to use a tetrode or pentode it's begging for
a triode audio amplifier stage in order to drive headphones. Any
so-called hi-Z headphones (nominally 2000 ohms) is 2 orders of magnitude
too low for the plate load of a tetrode or pentode in regen service, for
optimum gain. It'll work, but the audio output will not be too great.

Probably more than you wanted to know.

You regen guys ought to check out the Glowbugs list - see
http://www.af4k.com/glowbugs.htm
Lots of expertise up there on tube-type regens and simple transmitters,
among other things. Also the Regenerex (sp?) list that is totally
devoted to regen receivers. (I am a listmember of the former but not the
latter.)

It might work with a very low plate voltage (not more than 18V). It will squawk and howl at higher voltage because it is a high gain high power beam tetrode. The lower gain the tube the better they work. However, I have seen designs with high mu tubes and low voltages work.

You might trying controlling the gain through the screen grid with a pot.
Use an ignition coils high tension winding where you would normally put
headphones. Then use a crystal earphone across that. It should work with
one tube. That provides a high Z load that will more effectively couple AF
power to your eardrum.

12930. RE: [AWA] One tuber

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-03-26 20:15:45 UTC
From: Hue Miller
Topic: 12924 Message: 12930

I was last nite looking thru the booklet for the MRL one-tube ca.-1960s kit. They recommended a 1C5 tube and the regen control was a pot across the tickler winding. I was thinking this might be advantageous in that the B+ is always at the full value, never cut back. But the MRL text says "this means of controlling regeneration is fairly smooth". I was a little surprised at the word "fairly" and wonder what that means in comparison to possibly better methods.

Topic: 12924 Message: 12931

I built a one-tuber using a 12AC6 (12 volt heater & plate). Regen
control is a pot varying the screen voltage. It is very smooth, sliding
into and out of regeneration without the "plop". Regeneration starts
with about 6 volts on the screen.

Screen-voltage control in a tetrode or pentode regen works well - the SW-3 and legendary RAL/RAK receivers used that method.

As far as the pot across the tickler method, it would reduce the Q of the tickler, and, by inductive coupling, also the grid tank circuit, so I don't see much to recommend it. The regens I built as a young kid, before I understood this kind of thing (or much of anything, for that matter!) used this method. They worked - most of the time - but never too well. Of course that was probably do to a whole host of reasons.

They are very scratchy sounding too. I second the SG control method.
Although, due to laziness, I still haven't converted mine over from the
throttle cap. It is working nicely with that.

I might recommend after doing some data sheet reading, there is probably no better tube for a sharp cut off type of grid leak detector than a #32. I am using one, and it is incredibly sensitive with just one additional stage of amplification from a #30 to give it a little audio boost.

I am sure others work, but the #32 is the best.

Why did National use a remote cut off pentode for a regen detector?
It says right in the data sheet it is a poor grid leak detector.

http://frank.pocnet.net/sheets/029/5/58.pdf

Here is a good link to the schematics:

One of those old QST articles, that I read a few years ago, stated that remote cutoff tubes tended to make the transition in and out of the oscillation condition, more smoothly. My test of a 35/51 (remote cutoff version) tetrode, vs the 24A (sharp cutoff), seemed to confirm this statement.
I had a non performance reason for using the 24A, however. I found that a higher resistance value grid leak resistor (10 megs), yielded adequate results, with the sharp cutoff 24A, so that was the way I "went".

“It all depends” on how much of a loading.
There is a fellow on regenrx group who uses a separate winding with a pot across it for adjustable damping
control of regen, and he has gotten very smooth control and excellent sensitivity of his receiver with this.
He also claims no freq shift with regen control, which rather surprised me, as resistance introduced into a
tuned circuit SHOULD shift the frequency, according to the theory. Or maybe it’s too small to notice, in this
case.

12940. Variable Mu Detector in SW3.

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-03-27 12:18:21 UTC
From: Barry Williams
Topic: 12940 Message: 12940

See page 14 of the September issue of QST. Millen says that the tube data for the 35 States that their use as regenerative detectors is not recommended. He then refers to George Grammer's article introducing the 35. Grammer said that the information as stated by the tube manufacturers is correct as far as plate detection is concerned, however as a grid detector. National did some testing and found that the 35 works well as a grid detector. In addition with variation of screen voltage to gain was an inverse exponential curve. Gain increases rapidly at low voltage and as you approach oscillation, the increase in gain requires a much larger change of screen voltage making control near the point of oscillation easier.

It is interesting that all the autodyne project receivers in the 1937 Handbook use variable mu detectors.

Aren't we all!

I don't know off the top of my head why a remote-cutoff pentode would be a poor grid-leak detector, but I can take a SWAG: because of the remote-cutoff characteristic it's harder to develop enough grid-leak bias for cutoff, which probably effects efficient detection. Theoretically. But several experimenters report that remote-cutoff tubes are less finicky and go in and out of regeneration more smoothly. As you mention, the SW-3 uses one (the 58), and so do the RAL and RAK (the 6D6). Plus the paraset that Steve VE7SL mentioned as being a FB performer (a 6SK7). Hard to argue with success. "If it occurs it must be possible."

Yes, Lary you have the description of detection right according to some period books I have read. The tough thing is measuring a grid leak circuit with disturbing it. Especially when you have a crazy grid leak circuit like I do. I am running 12pF and 22Meg. I can wave my hand over it and hear it motorboat from several inches away. The receiver is insanely sensitive and likes to be as loosely coupled to the antenna as possible. I can't even use a small capacitor. I just bring the antenna lead close to the tank and the noise floor is at full volume. That maybe 1 or 2pF MAX.

Is your receiver in a standard SW3 cabinet and does it use the S101 coupler? National supposedly built some export receivers built to an RCA design. The audio used resistance coupling. Does yours have two capacitors and coils? I think the RCA design used an unturned RF stage, so only needed one tuning cap and coil for the detector.

Thanks,
Barry

12945. Match to 2-tube Royal?

12947. 6E5/6U5 brightener circuit?

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-03-29 18:24:02 UTC
From: Clare Owens
Topic: 12947 Message: 12947

Hi All,

In the box of "free stuff" that I brought home from the CC_AWA Conference were two small bags of parts that Ted Bryan had labeled "1st 6E5/6U5 brightener" and "2nd 6E5/6U5 brightener" and I have not been able to find anything on the Web that looks anything like what I have.

Each bag has the following parts:

Qty Desc.

2 1N4007 power diode
2 1N4148 switching diode
1 .1uf 630V mylar cap
1 ,022uf 630V mylar cap
2 2.2uf 450V electrolytic cap
1 4.7uf 50V electrolytic cap
1 500K miniature pot
3 1.0K 1/2W resistor
1 2.2K 1/2W resistor
1 1.0M 1/2W resistor
1 47K 1/4W resistor
1 470K 1/4W resistor
1 4.7M 1/4W resistor
3 5.2 ohm 11/4W resistors
1 1 ohm 1/4W resistor

It looks like this may have included a voltage doubler of the type used when converting from 6E5 to 1629 but all of the other parts are a mystery to me.

Do any of you have any reference material that might include a circuit with similar parts?

Thanks,

Clare

From: Barry Williams
Topic: 12950 Message: 12950

I have several (7 or8) Acme A-2 transformers. They appear to be interstage audio transformers. They are open construction with a black flat strip which has 4 thumbscrews with the typical markings (P G etc). Does anyone have any information on these?

Thanks,
Barry

Leonard,

I found a neat place on the Internet that has Popular Radio issues from 1922 to 1928. They can be searched, which allowed me to find original 1 page ads. It is a 4.25 to 1 audio inter stage transformer. It appears from 1922 to about 1927 in Acme ads. They claim to be the most popular transformers made, and suitable for up to 3 stages.

The site is americanradiohistory.com and it claims 2,000,000 pages on line.

Thanks Again,
Barry

Outstanding! This is a valuable site. One of the old magazines I've been looking for is a Radio Craft or Radio News from the late 40's or 50's that had a little one tube regen using a 9001 tube. It wasn't a great performer, but it was one of the first regens I built that really worked. I still have all the plugin coils for it and some of the parts, but I can't find the schematic anywhere. I have the site where most of the RC and RN magazines can be downloaded. I guess I'll have to download all of them before I find it.

This site has about all the Radio News. At the Radio News page far down to the left is a Search icon. You might try that. I have a National HFR receiver. I could not find much about it, but in Radio News it has a 5 page article, plus a few pages in the next month. It also has articles about Nationals MB tuners and audio amp. I have the amp and have an MB tuner spotted.

A real exciting find for me.

I have a National RCF and an RCL. They were made for the old CAA (later the FAA) I also have a Hallicrafters R-649A that was made for the Coast Guard. I had an SX-28FCC the was intended for headphones only but I gave it away. Documentation on these guys is hard to come by.

12956. 60Hz Hum?

Yahoo group: antiquewirelessassociation (2010 — 2015)

Topic: 12956 Message: 12956

I tried an experiment a couple of nights back. I unplugged all of the gear on my ham desk, and noticed the hum was gone on my breadboard style regen. Did hams before the thirties ever build radios with metal enclosures? Maybe this won't help if the hum is coming in from the antenna. However I noticed the top of the detector tube is REALLY sensitive to hum picked capacitively from my hand. I can get it within several inches and it starts humming like crazy.

Atwater Kent put a metal shield (lead?) on the very top of some tubes in early battery sets. Any connection?

Oh, yeah, that guy. There's a catalog, undated but of a vintage featuring the 4052 and 4066 breadboard sets, that lists the "No. 3970 Tube Shade." "The Atwater Kent Tube Shade protects the eyes." $1.00 for a package of 10. I haven't seen one in a while, but remember it as being painted their olive green color. The catalog illustration shows it atop a tipped tube, and it looks like a simple sheet-metal stamping..

Thoriated tubes (UX-201A et al.) didn't put put the bright light.

Hi Chris,
I experienced a similar problem, and a similar extreme sensitivity to "hand capacitance induced hum", in the vicinity of the tubes grid cap, as well as the grid cap end of the grid leak assembly.
I fabricated a crude shield, from aluminum foil, that covered the entire tube (a 24A), including a hood that surrounded the grid leak assembly. This reduced the hum level considerably.
It certainly isn't "pretty", but it does work!

I considered the possibility of experimenting with adjustable fixed bias, on the detector, in lieu of grid leak bias. That would allow the impedance from the control grid to chassis ground, to be a few 10s of ohms at 60 hz, vs the present 10 megohms.
However, I decided that the detector would not function correctly, in such a configuration, and I never gave it a trial.

I also have a few very heavy "chrome domes". They are about .100" thick
with chrome tops. I think they were to damp vibrations on the microphonic
early tubes. They have no provisions for tips, but were on globe 01As.

Hi Chris,

IIRC you used an insanely large grid-leak resistor. Bring it down to around 5 Mohms or so may help the hum issue. It is normal for the detector tube to be sensitive to nearby fields, but the super-sized grid leak may be aggravating the issue.

I love my 22Meg resistor :D That was the resistor that was in the
schematic, but I didn't start there. I tried reciprocal combinations
(constant R*C), and worked my way up to 22Meg. That was the loudest output
I could get. The receiver was crazy loud and sensitive for one tube. Even
with one tube I could here the noise floor. Now with two tubes loud
stations can actually hurt my ears, and there is no strain listening to
weak stations. I imagine that high R low C drives the tube right to cut
off where it is the most efficient detector. I wish I had a VTVM with
100Meg to measure it. I designed a little crazy sensitive bridge circuit
to measure it, but I never got around to building it.

I will try shielding that tube, but then she is not as pretty :(

Thanks,
Chris KQ6UP

I recently found that some of the hum (more like a low howl) in my regen was being caused by vibration of the partition between the detector and audio sections; accoustic feedback. The speaker would cause the partition to vibrate, varying the capacity between it and the unshielded detector tube. I put a small C clamp on the partition and it stopped the hum. I suppose a shield on the detector tube would also work, but I didn't use a shield type socket.

Astonishing website. I would like to learn more about how this site was
built. It can't be a one-man operation of this
overachieving David Gleason, can it?
I think I am going to contact him and offer to donate, probably, some other
obscure magazines or their missing
numbers. Their goal, as I assume it, seems very noble.
-Hue Miller

The site is americanradiohistory.com and it claims 2,000,000 pages on line.

Thanks Again,
Barry

Definitely a great service. Bill Fizette mentioned that the internet
archive now has all of "73" Magazine on line.
archive.org/details/73-magazine

These are from 1960 to 2002

I am glad you are enjoying that site.

Best Wishes,
Barry

I compared a couple original 1930s mags to the website pages.
One mag was scanned in a little too “contrasty” and it seemed, to me,
that the text characters had a little bloom.
The other mag looked like it was a little on the light side. In some photos,
I noticed a ‘pixilation’ effect, kinda like an old-time newspaper photo, or
comic book. I was trying to judge how good, how useful the scans were.
The scans were of course all perfectly readable. From the scanned covers
I saw that the quality of the originals varied. Of course, if one stopped to
optimize every scan, you’d never get done. I think my conclusion is, if you
absolutely want the best graphics, say, you own an uncommon radio
pictured in the magazine, or you want to scan some photos and schematics
yourself, like for use in an article, then it might be best to retain an original
hardcopy. Otherwise,well, the poundage does really add up, and you can’t
just store the originals anywhere, as repeated infusions of moistore and
drying out, weakens and tends to dissolve the paper slowly. Maybe the
acidic content of the pages helps this along.
A few years back I bought HR on CDs and then sold all my paper HR’s.
Lovely and as fun as they were, I felt relieved to see the 70 lbs. or so
off my list of possessions.

Yes,

I have 1923 through current QSTs. The 1923 through 1959 are bound 6 to the book. 1960 through 1975 are bound 12 to the book, and 1976 to about 2005 are loose in ARRL binders with the rest loose. They and a group of handbooks fill 2 bookshelves. I have toyed with selling them as I have the 1st issue through 1949 on CD ROM.

I love searching electronically ... but to read and photo pages to use in displays
I still try to save paper publications but as Hue brings up... a lot of space and weight...

The fantastic ability to search thousands of pages for the occurrence of a name is... PRICELESS! you could manually browse and scan pages get to the end and if you blinked you might have missed it in a paper search anyway.

a few more thoughts///

For coping stuff the loose bound in ARRL binders work best, or
loose...
our QSTs are all loose as are our CQ's

We have journal of society of motion picture and television engineers
in those wire retainer thing binders ... and we have some that are
sewn bindings and the tight margins of the sewn bindings are a challenge
when you need a photo close to the margin... many times we end up using
the Nikon here and photograph the image.

As you noticed the OCR of these old documents is not perfect, but it is surprisingly good. On Radio News I grabbed all the contents pages. Lots of interesting articles I would not have found in a search. Bill Fizette also noted that 73 magazine is on the internet archive. Now if CQ were to offer CD Roms of back issues.

S40B was a good for for SWLing as a kid as I remember it..and it but
it may have helped too that I was on a large property that I could sting
great longwire antennas . also being at the top of the hill in palos
verdes calif was great for elevation and also no industry around.

the only BAD time to SWL there was when the Nike Site LA-55 fired off
the HIPAR radar and when that thing would swing around it would saturate
the front end on ANYTHING!

A small inconvenience to put up with for having such great
friends...heh it was like having a bunch of older cool brothers that all knew
about radios and radar and generators etc. my parents hated how it loaded
up the stereo in the living room though!

sure Will! Don Wallace.

Funny story... as a kid you could scrounge any parts you
needed to build stuff from Hams... old Don being the parts distributor
background he had would take a resistor out of his desk drawer, show
it to you and say " you can buy these at the radio store" and put the
damn thing back in the drawer......

interesting guy... but a bit on the tight side.

He lived in long Beach but had bout the press wireless site in PV
sold a lot off for development (making his second fortune) ... and kept
the nexus with the buildings and had a whole series of rombics there.

Amazing guy.... could carry on a conversation in the car send code...
and drive at the same time.

His wife would accompany him to the station and as he would operate
she would quietly knit at times. a dear lady and very patient of Don

Blueprints for the 1938 RCA Empire State TV antenna discovered at SMECC
Is it unusual to have these?

They were in a file box with the Brookhaven Cyclotron Blueprints.

they have been probably folded up since '38 I need to 'relax' the paper
but in the meantime have been transferred to the banks vault in case
this is the only set
around.

This would be the antenna used for 39 worlds fair historic
rollout eh?

I purchased a UX-6 based coil form for my regen receiver. I would like to use the same specs to wind this coil, so if I am ever able to purchase a SW3, I will already have coil/coils for the radio. Can anyone help me out with this? I already have the coil socket, and the coil form in the post. I see in the schematic that these coils include pads (I assuming to adjust the band edges and align the detector and preamp tank circuit).

There are different coils for this series. The color coded coils are for the SW5/SW45. There are three series of numbered coils. From my not too good memory one series started with 10, another with 60 can't remember the other set. They were supposed to be different only in the tickler. The earlier coils needed more feedback. In comparing the different sets, I noticed a difference in primaries. As I recall, the only coils with the trimmer were band spread coils. The SW-3 is divided into 3 variants. The last is hard to find and uses octal tubes. The SW3 is pretty simple to duplicate, but there were a huge number built, so finding one should not be too hard.

I've made "grid leaks" from old glass fuses and mounted them in regular fuse clips. They don't look all the authentic though.

A real old time grid leak was a piece of paper with a line across it from a graphite pencil. Resistance can be changed by heavier or wider mark. The problem came with humidity. Once you get the resistance correct, seal it in a glass tube. Several years ago I bought an assortment from Gary for a Pilot Wasp. He even put in a few Pilot branded paper logos from open resistors. At that time he had a few grid leak clips with fixed capacitors built in. Typically 100 or 250 mmf.

Get india ink on smooth thin cardboard and draw line . Measure. Add layers to get to 1 meg. Mount to screws brass type or tel key type terminals to sqeeze connect. Cocer oaper with krylin or q dope or clear nail polish whule held ib clamp. Dont get on conctr area. Thus guves 1920 hb sryle grid lk. I used on my first regen. Karl
Cell keys too smalk.

12991. The Audion

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-04-12 00:20:40 UTC
From: Chris Maness
Topic: 12991 Message: 12991

I have been fascinated by early radio technology. Some of it I have been working on either building or getting SPICE models working. I have figured out how grid leak bias works fiddling around with these things. After trying many different tube models I was able to get a nicely working regen circuit going in spice.

The first project I worked on was a oscillating Audion receiver found on page 93 in the 1May 1916 issue of QST. I used a JFET wrongly thinking that it was an analog to the Audion. Surprisingly the thing worked and was sensitive enough to pick up WWV and WWCR in Tennessee from Southern California.

I later found out that the Audion was never really an amplifier (in the linear sense) as much is it is a detector. It is filled with gas (I think I've read Hydrogen). It had a real sweet spot for proper operation, and almost every possible parameter of the circuit was tweekable to get it working properly. I see it as a sharp cut off tube that has an internal grid leak (due to the gas). The sharp cut off characteristic would make it a good detector. This is mentioned in period books I have read.

The must have started off with more gas in the Audion because the first mention of a grid leak in that same issue of QST was suggested as a cure for the detector clamping due to strong signals and taking time to recover from the strong signal. The short article mentions this pencil mark on paper for draining of "static" from the grid circuit. This is on page 100. The article also mentions this is a new problem that occurs with the improved versions of the Audion.

Has anyone else really taken a close look at Audion technology and could share some of the nuances that they have found?

At one point I also had found a reference to a more modern tube that used Hydrogen in a triode as a detector, but I could not re-find the link. I know thyrotrons can contain Hydrogen, but I am not sure if they have similar characteristics to the original Audion. It sure would be cool to play with a reproduction Audion. I am very curious as to how sensitive those early sets were.

I hope this quick little write interests some of our members that are interested in pioneering and/or primitive radio technology.

I am a physics teacher, and I plan on having my kids build a simple radio circuit for our year end project.

p.s. Doing a little scraping around I found that the UV-200, UV-300, and UV-300A are gas filled triode detectors. The first two used Argon, and the 300A used Cesium vapor.

Chris,

The next issue of the Journal has an article about the National SW4. In it I mention that the original detector was a type '00. Most I have seen are 200As. This was a so-called Soft tube, a soft vacuum rather than a hard vacuum. Normally these were run at 45 volts on the plate. They were more sensitive than the '01A, but also more noisy. I am guessing shot noise. Most users swapped to 01A detectors.

You can imagine that a gaseous tube operating very near breakdown voltage would be very sensitive a small grid voltage would bring on breakdown.

You might read of adjustments of voltages on an audion to get it near the blue glow. Too much voltage and breakdown. I believe that the blue glow is Cerenkov radiation. When the electron beam hits glass, it gives up energy.

At least that is my understanding. I need to power up my SW4 and try it with both 00 and 01 detectors. I should also vary plate voltage. RCA probably adjusted the vacuum to insure that at 45 volts you are below breakdown.

So you might want to look at the 00 tube information. I don't think they were produced for very long. All I have seen are Globe type.

No, Cherenkov radiation is the same color, but it comes from relativistic speed electrons decelerating when the move into a dielectric medium where the speed of light is slower than that of a vacuum.

> When the electron beam hits glass, it gives up energy.
>
Yes, this is true. Whenever the gas in the Audion, it is ionized once the plate voltage is increased to breakdown voltage. It is a simple plasma, and when the electrons recombine with said ions, they emit a photon of light with a specific wavelength. Probably Nitrogen or Argon since it is a blue color.

Yes, I actually found a data sheet with curves. Now to figure out if their characteristics were close to that of the Audion. If so, I can build a circuit much like that of what I found in the 1916 QST. I am sure 00A's are cheaper than a real Audion :D

Someone had written about Cherenkov radiation and used the example of vacuum to gas. At our lab we are applying a diamond like coating to metal substrates. We inject a material bearing carbon, acetylene, propane, etc. We use a bit over a kilovolt in up to 100 amp pulses to create the coating. We use plexiglass connectors so we can watch the plasma.

I crossed with you, '00s are not cheap, but definitely cheaper than an audion. I got my spare from Playthings of the Past.

Some high vacuum tubes actually produce a blue spot on the glass. The audio guys mention it. I think in that case it may be Cherenkov radiation, but agreed I'm the soft tube it is a plasma. I used a pair of McIntosh tube type amps for a few years. These had glass 6L6s Those did develop a blue spot on the envelope.

At what plate voltage due they produce the blue spot in that 6L6? The
calculation is not too hard to see how fast they are going. If they are
going faster than the speed of light in glass, then it probably is
Cherenkov radiation.

I am not sure, this was about 35 years ago. The amps were actually specified for a metal RF certified version of the glass tubes, maybe a 1614?

It will be interesting to see if a Spice model can be built for the curve below breakdown and above.

I remember a question on an EE final exam that have acceleration voltage and an electrostatic deflection plate voltage and length to the phosphor. We had to calculate the position of the spot on the CRT. This was pre-calculator and no reference material only a few remembered that for small angles the sin and tan are about the same and are approximately equal to the angle expressed in radians. It would be interesting to see how many students of today would think of that. (I did remember).

Thanks,
Barry

The first issue of Radio News has an article by Lee DeForest "The Audion and the Amateur" in which he mentions low vacuum, high vacuum and the blue glow. He mentions blue spots that appear with strong signals.

Hi Barry -

What you said is a little misleading. Nothing goes faster than the speed of light. However, in various mediums, light travels at a speed less than the constant "c". If an electron beam can travel faster than light would in that medium, then Cherenkov radiation can occur. Regardless, that speed will still be less than "c". Regards - Mike

Someone had written about Cherenkov radiation and used the example of vacuum to gas. At our lab we are applying a diamond like coating to metal substrates. We inject a material bearing carbon, acetylene, propane, etc. We use a bit over a kilovolt in up to 100 amp pulses to create the coating. We use plexiglass connectors so we can watch the plasma.

At what plate voltage due they produce the blue spot in that 6L6? The calculation is not too hard to see how fast they are going. If they are going faster than the speed of light in glass, then it probably is Cherenkov radiation.

Nothing goes faster than the speed of light in a vacuum. When the electron transitions into a region of higher dielectric constant, the speed of light decreases to that of one over the index of refraction. Electrons accelerated by a plate voltage of 500V are somewhat relativistic, but only about 1/10c. Unless the glass has an index of refraction greater than 10 it is likely not Cherenkov. I will hold out the possibility that the non uniformity of the electric field could slingshot some of the electrons faster than 500eV. However I don't know how this would work,and would be fascinated to find out.

The speed of light is a constant....,NOT. The speed of light changes when you approach the event horizon of a black hole.

You can say the beam travels faster than light with the qualification that
we are not talking about a vacuum.

Barry,

In Volume III of the Proceedings of the IRE (1915), Deforest and Armstrong get into heated debate over the audion's vacuum. The debate starts on p. 239. Armstrong took the position that a vacuum was needed; Deforest insisted that Armstrong's analysis was flawed since he opined that the audion required ionized gas. Armstrong was right, and it showed that Deforest really knew little about the triode's mechanics.

IMHO, both the triode and regeneration were both discoveries (rather than planned invention) through experimentation, and neither discovery ever deserved patent protection. If there was methodical reasoning to reach the end circuit, then that's a different matter. But by all accounts, the triode and regeneration were discovered in a "hmmm...let's see what happens when we do this" fashion. I've read through the litigation material, and the more I read, the more I've been inclined to stick with this position.

I believe the blue spot story. It is more likely the phosphorescence of ionized glass from electrons bombarding the envelope. To be sure you would have to look at the spectra of the dot. It could be line emissions in the blue range. Cherenkov is a continuous spectra.

Sorry Mike, got interrupted in my answer. I knew what Chris meant, so
didn't say anything. I didn't figure anyone was reading along.

The DeForest article talks about the little blue "imps" developing at the
corner of a plate in time with an incoming strong signal. So he was
running the audion at the edge of the plasma "avalanche". I think
modelling that device would be difficult. The 00A is probably the closest
to the audion we can afford to experiment with.

I will be retiring in a couple of months, and have several '199 tubes.
Prior to the Tetrode, the '199 was the triode with the lowest grid plate
capacitance. It was used in Browning Drake receivers as an RF amplifier.
They used a neutralizing capacitor, but called it "Balancing". Browning
wrote an article describing the B-D coils for up through 40 meters. I want
to experiment to determine if the triode will work at that frequency.

The gas in the Audion was whatever was whatever was left (air, water vapor, CO2, city heating gas) after the not-very-energetic pumpdown, plus whatever junk evolved from the bulb and elements after seal-off.

It is ironic that De Forest clung to his runs-on-ions theory after real technologists had figured out the need for vacuum in amplifiers. Big Lee, in the De Forest Co. promo pamphlet handed out at the Pan-Pacific Exposition of 1915 after AT&T had started transcontinental telephone service with real vacuum in their tubes, plugged the notion of the happy little ions doing the job, whereas GE and Western Electric had spend huge research effort GETTING THE IONS OUT.

It's a little dangerous to compare the ( )-200( ) detector tubes to the Audion. I know an individual who has 40 (!) Audions, of which no two are the same physically. One may easily assume that the manufacturing processes for these were greatly different, one to the next, as to preparation of the mounts (or lack thereof) and pumping schedule. By contrast, the ( )-200( ) tubes were made by real production engineers with the experience of making a million or so high-vacuum tubes in WW I, using hydrogen firing of the unassembled elements, "bombarding" of the mount during exhaust, and including getters to absorb the vagrant gases. The idea was to produce a standardized detector, with known and controlled gas content, with which the BCL d-i-d-n'-t have to fiddle with delicate adjustment of the plate voltage.

Ludwell Sibley

Subject: [AWA] The Audion

I have been fascinated by early radio technology. Some of it I have been working on either building or getting SPICE models working. I have figured out how grid leak bias works fiddling around with these things. After trying many different tube models I was able to get a nicely working regen circuit going in spice.

The first project I worked on was a oscillating Audion receiver found on page 93 in the 1May 1916 issue of QST. I used a JFET wrongly thinking that it was an analog to the Audion. Surprisingly the thing worked and was sensitive enough to pick up WWV and WWCR in Tennessee from Southern California.

I later found out that the Audion was never really an amplifier (in the linear sense) as much is it is a detector. It is filled with gas (I think I've read Hydrogen). It had a real sweet spot for proper operation, and almost every possible parameter of the circuit was tweekable to get it working properly. I see it as a sharp cut off tube that has an internal grid leak (due to the gas). The sharp cut off characteristic would make it a good detector. This is mentioned in period books I have read.

The must have started off with more gas in the Audion because the first mention of a grid leak in that same issue of QST was suggested as a cure for the detector clamping due to strong signals and taking time to recover from the strong signal. The short article mentions this pencil mark on paper for draining of "static" from the grid circuit. This is on page 100. The article also mentions this is a new problem that occurs with the improved versions of the Audion.

Has anyone else really taken a close look at Audion technology and could share some of the nuances that they have found?

At one point I also had found a reference to a more modern tube that used Hydrogen in a triode as a detector, but I could not re-find the link. I know thyrotrons can contain Hydrogen, but I am not sure if they have similar characteristics to the original Audion. It sure would be cool to play with a reproduction Audion. I am very curious as to how sensitive those early sets were.

I hope this quick little write interests some of our members that are interested in pioneering and/or primitive radio technology.

I am a physics teacher, and I plan on having my kids build a simple radio circuit for our year end project.

In the Radio News article DeForest fusses a bit about losing the gas for the hard vacuum.

It looks like a 200 would generate a plasma if you increase the plate voltage. As you mention, Audions were each different. So we could never set a standard operation procedure for an audion. I know there are other special use tubes with gas in them. I don't know of a fairly common tube that you could run at the edge of breakdown. You couldn't duplicate an audion, but you could experiment with operation at the edge of breakdown by upping the voltage on a 200A.

Thanks to all for contributing information to this thread. Though I am primarily learning. I've never seen an audion other than pictures in Tyne's book. It seems someone made a run of special tubes a few years ago. I think that they looked like audions, but were probably more standardized.

From: Barry Williams
Topic: 13013 Message: 13013

Does anyone have experience with the 860? Particularly if operated as a triode? I have the data sheets, just wanted to touch base with someone who actually used one.

Maybe you could first experiment with a thyratron, like a 2D21, before risking a '200.

Subject: RE: [AWA] The Audion

In the Radio News article DeForest fusses a bit about losing the gas for the hard vacuum.

It looks like a 200 would generate a plasma if you increase the plate voltage. As you mention, Audions were each different. So we could never set a standard operation procedure for an audion. I know there are other special use tubes with gas in them. I don't know of a fairly common tube that you could run at the edge of breakdown. You couldn't duplicate an audion, but you could experiment with operation at the edge of breakdown by upping the voltage on a 200A.

Thanks to all for contributing information to this thread. Though I am primarily learning. I've never seen an audion other than pictures in Tyne's book. It seems someone made a run of special tubes a few years ago. I think that they looked like audions, but were probably more standardized.

Howdy all-

Reading the banter about the Audion started me musing about the foibles of measuring the characteristics of the original bulbs-- some now pushing past a century. (Did the character who made the bogus Audions some years ago ever pump the air out of them?) I started wondering about the quality of McCandless' vacuum seals? I have heard that RCA's CRTs used in the first color TV-- the CT-100 tend to have flaws in their glass to metal seal(s) and thus over the 60+ years have now "leaked" enough to seriously hinder the vacuum quality within the relatively large space of the CRT. So with their "light bulb" quality construction-- top 'n' bottom presses, lack of any sort of gettering or hard vacuum processing, have the vacuums/atmospheres of most of the original Audions become contaminated by now so that their present characteristics have little bearing on what they originally had rolling off McCandless' production line?

Well, at least the tube audio guys haven't jacked up the price.
Apparently they haven't yet discovered the transparent, vibrant tones of
a soft-vacuum detector tube in audio service ;-)

I don't think it's possible for electrons to exceed the speed of light
in a vacuum or any other medium.

I think the velocity is slower in glass than in a vacuum.

13021. Wood Case Needed

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-04-13 23:06:08 UTC
From: Chris Maness
Topic: 13021 Message: 13021

Hello, all. I built this three tube set (at least two of the three stages), and I am really happy with its performance. It is all ugly and breadboardy looking with a hodge podge of new and old parts. I really want to make a nice finish for this radio. Here is the problem. I have recently decided to go back to grad school and earn my master's degree in physics. I don't have any wood working tools, and I am not really much of a wood craftsman anyhow.

Would someone be willing to fabricate said cabinet for ~$100? or Does someone have a battery radio cabinet without guts that they would be willing to sell?

Here is the project:

http://www.w7ekb.com/glowbugs/rx/Regens/KW7WT_2.gif

I left off the last stage because it is PLENTY loud into crystal headphones. I also left off the shunt cap and resistor going to the grid of the second stage. I do have them on an alligator clip for loud stations. It improves the audio quality, but at the sacrifice of a lot of volume for weaker stations. I might add the last stage if I put it in a case. The only thing that is holding me back is that I am cheap and don't want to have to keep buying 45V batteries. The radio only used 700uA with the first stage. Now it is a hog at 2.7mA with the '30 stage after the detector :D Another stage, and I will be at 5mA B+ and 180mA for the A circuit.

Thanks,
Chris KQ6UP

Date: 2014-04-14 00:50:39 UTC
From: Barry Williams
Topic: 13025 Message: 13025

I ran some tests on the A2 transformers. They were flat from 100 Hz to 1.5 KHz. The ratio was about 4 to 1 as specified in the ads. The output voltage rose from 7 volts to a peak of 35 volts at 5.35 KHz. At 7.5 KHz the output is back to 7 volts dropping to 4 volts at 9 KHz. Between 100 Hz and 3.5 KHz they should sound OK. I had a Silver Marshall Senator transformer which I had checked for resistance quite a few years ago, I put it on test to find that the secondary is open. I have some Pilot transformers that I have to find so I can test them.

Purely coindicently, I was just recently reading some magazine such as “Broadcast”, from 1929 or thereabouts, and saw an ad from a transformer manufacturer touting their own high-quality audio transformers and comparing them to run-of-the-mill products. Sure enough, the included graphs showed the “brand X'” transformers with an uptick in response in their upper range, while this company’s product had a pretty level response up to 6 kHz or so, then a falloff, distinct but not precipitous.

Thanks for the information. I went through my box and have 9 brand X. Transformers. I noticed in some early National audio equipment they had a scratch filter. Looked like a simple low pass filter. If I only needed some 5.35 KHz IF transformers I would be set.

I have really enjoyed the information at americanradiohistory.com. There were a series of Millen articles about frequencies above 30 MHz. Or the quasi-optical frequencies as he calls them. Excellent information on my HFR, including coil winding data. Bad news is that the detector is connected to the antenna, so he says any non resonant antenna will work. So much for my 5 element 6 meter antenna.

I had seen Kris Walter's page on his replica Eveready 467 67.5 Volt replacement (which I needed for some old field intensity meters for work):

http://www.greenhillsgf.com/IndexOwn_63V_BatteryKit.htm

But your battery pages are more more detailed, and I prefer the way you handle your artwork. I know I will want to build replicas of some of those batteries some time after I finish the current reworking of The Compact Shop.

13043. Jensen D8 Speaker Cone

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-04-18 06:16:20 UTC
From: Barry Williams
Topic: 13043 Message: 13043

Does anyone have a repair shop that could re-cone a 1930 Jensen D-8 Speaker? It is probably called a 12" as that is the mount spacing. The cone is closer to 10" in diameter.

Thanks,
Barry
KD5VC

If you are interested in old spark gap and arc transmitters, receivers and spark keys, you are invited to visit or join the Spark Gap Radio Collectors group. We have great photos of amazing pieces of history.

The group provide a forum for the exchange of information on spark gap and arc transmitters, keys and related components, and to assist in identifying unknown items.

Come take a look!

Topic: 13048 Message: 13048

I have just finished a major reorganization of my rather space-challenged home workshop, and I thought I would share the results with you. I have a number of vintage instruments in use, and many more stored away. I do have a number of instrument catalogs on the shelf, as well a number of other published resources and a variety of equipment that you might enjoy seeing.

Nice job, Dale. Now maybe you can organize my shop. My biggest problem is laying something down and then spending the next hour or so looking for it. One thing I didn't see in your shop; your junk box.

I scored a bunch of printer paper boxex some time ago. I numbered each one, and the shelves they were on, and entered the data into an Excel spreadsheet, listing the contents of each box. The spreadsheet can be reorganized alphabetically, or by box number, so I never have any problem finding anything. Order out of chaos. The workbench is a different story.

I have done something similar for some of my parts stock. The largest spreadsheet is for tubes, including date and purchase price when known, and gm readings for used tubes. The sheet also shows which tube caddy a given tube is stored in. I have similar but smaller sheets for dial belts, audio transformers, power transformers and chokes, and a variety of NOS parts from Miller, Meissner, Philco, General Radio, and other manufacturers.

13057. SQCRA basket case restoration results for 2013 posted

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-04-21 14:42:52 UTC
From: <kd4hsh@...>
Topic: 13057 Message: 13057

Just saw a posting on The ARF that the SQCRA basket case restoration contest results for 2013 have been posted.
http://sqcra.org/interrestocontest/international_rrc/internationalrestocontest.html
http://sqcra.org/interrestocontest/international_rrc/internationalrestocontest.html

MAARC entry scores last... Woo Who!
That's fine with me....

Here is what I sent to what I think is the contest chairman....

Thanks to SQCRA staff for posting an announcement of 2013 contest results/reports on Antique Radio Forums.

I am reminded that there is a tremendous amount of lost information on 'how to do stuff'.

Thanks to contests like this, I'm seeing folks taking the time to actually put in writing and pictures narratives on processes they have developed.

Many of the techniques leave me thinking there is a better way, but I can still find new methods to at least consider.

I really like seeing the comments of the judges even though sometimes I can take issue.

Just seeing the reports, helps me to think of ways to improve my documentation and communicate my ideas.

I'm not likely to score at the top in this type of competition any time soon. With health problems I am concentrating on conservation & documentation of radio artifacts of more historical merit in my collection rather than showcasing 'my chops' at re-manufacture of basket case more-or-less common radios.

My entry scored last in your criteria but that is OK.... You might find one of my projects again making it to competition in the future.

All the best,
Robert in the Carolinas, USA

13058. Speaker / Field Coil Plugs for Electrodynamic Speakers

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-04-21 19:02:38 UTC
From: Dale H. Cook
Topic: 13058 Message: 13058

Some of you may be familiar with my Universal Shop Speaker and Dummy Field Coil:

http://plymouthcolony.net/starcity/radios/pages/unispkr.html

I would like to expand my section on speaker plugs and cables for use with that project:

http://plymouthcolony.net/starcity/radios/pages/spkrplug.html

The cables that I show on the latter page used in a number of post-WWII Zenith sets. The first cable I would like to add was used in some RCA sets, such as the 1939 T-63 and T-64 sets. It used a 3-pin plug. If anyone has one of those sets and can contribute information about the speaker plug used I would like to hear from you with those details.

If anyone would care to provide information for other sets I would appreciate that as well, especially if you can provide the field coil resistance, output transformer primary impedance, wiring details, or other information of use for expanding those pages. I have all of the Rider volumes, as well as several RCA Red Books and some Zenith and Philco service volumes, so I may already have some of the needed information for some of your sets. All contributors will receive credit on my pages next to their contributions.

My goal is to not only expand the page on speaker plugs and cables, but to add an additional page providing, for a number of chassis, the plug-and-cable used along with the switch settings for the Universal Shop Speaker and Dummy Field Coil.

Dale H. Cook, GR / HP Collector, Roanoke/Lynchburg, VA

13059. Electrodynamic Speaker Plug Data

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-04-22 15:16:07 UTC
From: Dale H. Cook
Topic: 13059 Message: 13059

I am working on some major revisions to my Universal Shop Speaker and Dummy Field Coil:

http://plymouthcolony.net/starcity/radios/pages/unispkr.html

including additions for sets with a second field coil and sets where the voice coil is wired to the speaker plug instead of the output transformer primary. As a part of those revisions I have begum expanding my selection of speaker plug cables:

http://plymouthcolony.net/starcity/radios/pages/spkrplug.html

and I have begun to compile tables showing the appropriate cable and switch settings for a number of sets. There are three stumbling blocks that list members might be able to help with.

1) For many sets the field coil resistance is not shown in Rider, Beitman, or manufacturers' service volumes. Finding the correct setting for the universal output transformer is pretty simple as I have plenty of tube data and can determine the appropriate load resistance for almost any output circuit. Figuring the field coil resistance is not so simple. Do any of you know of any compiled data about the field coils used in various sets? Failing that I would just have to suggest starting with the highest resistance that my dummy field coil offers and reducing it stepwise until the correct output plate voltage is achieved.

2) For many sets that incorporate speaker plugs (many pre-WWII Zeniths come to mind) the speaker plug wiring is not shown on any schematics. Do you know of any compilations of that information that I could access?

3) Some sets connect the voice coil to the speaker plug instead of connecting the output transformer primary. Are there any good compilations of data on old voice coil impedances?

I can dig up some information by roundabout means. Sams' Radio Industry Red Book, for example, sometimes shows replacement parts for which I can find, say, the field coil resistance or voice coil impedance. For other sets the manufacturer bought a speaker, transformer and field coil assembly from a manufacturer such as Rola. Does anyone have catalogs from '30s and '40s speaker manufacturers such as Rola that contain information such as field coil resistance? If so, would you care to share scans to help to further this project?

13060. UX 874 Voltage Regulator

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-04-24 20:16:04 UTC
From: Barry Williams
Topic: 13060 Message: 13060

I just realized that RCA introduced a voltage regulator tube in the 1920s.
I wonder why we don't see them used in oscillator circuits of that era.
Particularly in Superhet high frequency oscillators or MOPA transmitters.

An interesting line up might be a 24A electron coupled oscillator voltage
regulated by an 874, light capacitive coupling to a 2nd 24A followed by an
865 and whatever finals you want.

Folks,

I have been trying to locate an article in the January 1928 issue of Modern Wireless on the "1928 SOLODYNE" with no luck with the groups or book sellers or auctions.

I see that it is in the holdings of the New York Public Library, Science, Industry and Business Library. TTFA (Modern wireless) Library has: Vol. 1, no. 1 (Feb. 1923)-v. 9 (June 1928), v. 12 (July 1929)-v. 20, no. 84 (Dec. 1933). http://catalog.nypl.org/availlim/search%7ES1?/cTTFA+%28Modern+wireless%29/cttfa+modern+wireless/-3,-1,0,E/2browse

Anyone here ever do research there? I've never done it before... Is it possible to hire someone to find the article at a price that is affordable to retired mere mortals like me?

Robert

I've done extensive research at SIBL and it's quite easy - except that much material is kept offsite and you have to request it in advance. However, as Modern Wireless is marked AVAILABLE it looks like what you want is actually at the library.

For offsite items NYPL will scan a limited number of pages to PDF at no charge and email the file to you. It would be worth asking if they could do this for the article you need.

13063. Wire Data

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-04-26 15:11:40 UTC
From: Barry Williams
Topic: 13063 Message: 13063

Someone was looking for information on winding coils originally specified for fabric covered wire. I noticed that the 1937 Handbook from ARRL has an appendix table that shows the number of turns in one inch for enamelled, silk insulated and cotton insulated wire.

An example would be a coil wound with 28 gauge DCC (double cotton covered) wire would have 48.5 turns per inch when close wound. 28 gauge enamel would have 72.7 turns per inch. However, if you drop to 24 gauge enamel wire you would only have 46.3 turns per inch.

Since wire diameter doesn't appear in the formula for inductance, it appears you could use this table to approximate a change in wire gauge to get equivalent coil specs for enamel covered wire versus the fabric covered wire specified in old projects.
There were several other tables and graphs that were useful. Db versus power or voltage ratios, resistor power rating versus resistance and voltage drop, and two pages on calculating Inductance and Capacitance.

I scanned these to a PDF file. I think it would be useful to have this data available on a web page. Any ideas?

Hi Barry,
Thank you for sharing! Your plans are very interesting! You didn't mention if you intended to use your creation in the BK QSO party. I thought that perhaps I should pass along a heads up, re the ECO portion of your plans.
Technically, an ECO wouldn't be eligible for this event, as it is a post 29 invention. I thought that you may prefer to learn this, prior to construction, rather than afterwards. Don't ask me how I know!! (My glitch was due to a misunderstanding about the vintage of the type 46 tube. Due to this hiccup, I ended up with several 46 tubes, that I purchased, and will never use!)
A slight mod, such as using a 27 oscillator (or a triode connected 24A), in lieu of the ECO stage, would allow the xmtr to be eligible.
I hope that this info is useful. It is not intended to be discouraging, in any way.
I will be looking forward to reading abt ur progress!

Ron,

I really appreciate the heads up. I had read the early 30s article about the development of the ECO and knew it wouldn't fit within the rules. I was just wondering what performance was available. I don't know why we don't see the 874 in any of the early articles. I have ordered one and will run some experiments. The ECO just allowed one tube to act as two, so a 27 oscillator and buffer should give about the same result.

I don't know why crystal control isn't allowed. There are several articles in per 1930 publications about crystal control. I am guessing they wanted the signals to sound "typical" of 1929. I had thought about machining a crystal holder from one of those articles. I have a couple of large Bliley crystals for 80 meter CW that could be disassembled and the crystal put in one of those holders.

I have looked for a 1929 RCA tube book on the internet without success. The 47 crystal oscillator driving a pair of 46s was a classic 1932 design. Art Collins used it in the 4A transmitter.

It would be nice if AWA were to add classes to the contest, maybe pre 1930 transmitter and receiver for bonus points, then a class for pre 1930 transmitter and any receiver worth a few less points per contact, then perhaps a 1932 class, with less points per contact. That class would allow cheaper tubes, crystal control,receivers like the QST single signal superhet.

I will breadboard a "legal" 1929 oscillator and try it with and without regulation.

The AC power supplies for the RAL/RAK regenerative TRF receivers employed the 874 to feed regulated 90V to the 6D6 regen detector. The design is ca. 1936 and they were used shipboard for many decades.

Thanks Larry,

I was primarily interested in the receiver and transmitter articles for the hams of the later 20s. In 1932 and 1937 Handbooks Voltage Regulation refers to multiple taps on power transformers. Of course a lot of early receivers were battery powered. A 1926 catalog shows the 874 regulator. It also shows bulbs with fixed voltage drops, basically the same type of action.

I will look for a RAL schematic.

Subject: [AWA] Wire Data

Someone was looking for information on winding coils originally specified for fabric covered wire. I noticed that the 1937 Handbook from ARRL has an appendix table that shows the number of turns in one inch for enamelled, silk insulated and cotton insulated wire.

An example would be a coil wound with 28 gauge DCC (double cotton covered) wire would have 48.5 turns per inch when close wound. 28 gauge enamel would have 72.7 turns per inch. However, if you drop to 24 gauge enamel wire you would only have 46.3 turns per inch.

Since wire diameter doesn't appear in the formula for inductance, it appears you could use this table to approximate a change in wire gauge to get equivalent coil specs for enamel covered wire versus the fabric covered wire specified in old projects.
There were several other tables and graphs that were useful. Db versus power or voltage ratios, resistor power rating versus resistance and voltage drop, and two pages on calculating Inductance and Capacitance.

I scanned these to a PDF file. I think it would be useful to have this data available on a web page. Any ideas?

Btw i have early and mid 50's and 90's Handbooks but they seem to have dropped the old 1930's info. I wind by gut feel and a dip meter with old voil and known cap to find redonance and then inductance. That table would save time. My first rig used dcc wire in regen and 6L6 tritet osc. Havr not seen it ages. 73

Karl,

I am working on a PRO310 article for the next Journal, so we have several months until I would really need something. The NC-190 could certainly make an article. The only NC series radio I have is an early 101X. It has the "Eye" tube instead of the S Meter.

Thanks Again,
Barry

13076. Crystal Radio For My Physics Class?

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-04-28 15:28:24 UTC
From: Chris Maness
Topic: 13076 Message: 13076
Attachments: 1 described; binary payloads are missing from this source WARC

I want to have my kids build a crystal radio for their end of year project. I would like the coil form to be on an oatmeal carton for the High Q coil. How many turns would I need to use a tapped coil tuner to cover the am band? I was thinking of trying self resonance of the tank coil, another version with a fixed cap and taps. Then a fixed coil with a variable (10-365pF) cap.

If no one knows the turns for the coil off the top of their head, no worries -- I can calculate it. However, I know the equations for the coil are always a little off. Spider coils might be a little easier to wind so that is a possibility too.

I have attached the schematic. If the attachment doesn't show up, I can post it in my photo album in the group.

Thanks,
Chris KQ6UP

Chris,

My first crystal set used a slider on the coil and a fixed capacitor. As I recall the coil was about the size of a toilet paper roll. The winding was about 3 1/2" of enamelled wire. You used sand paper to bare the copper. The slider was a piece of bent metal. The crystal was actually a chunk of metal in a cup with cat's whisker.

It might be easier than finding the variable capacitors. Not having winding data, but otherwise giving a good description of building an early crystal set is the book "The Radio Boys First Wireless" by Allen Chapman. It is available for free download on the internet. It even describes building the fixed capacitor. Melting wax, soaking paper squares and cutting foil for the plates. You could excerpt the construction section from the book to show the kids how it was done almost 100 years ago.

Good Luck,

Barry

Why not just wind a coil with more than enough turns and use a slider to select the portion you need. My first xtal set had a 5" dia coil and was about 7" long, wound with #18DCC wire. Worked fine, lasted a long time. Of course, back then we only had two radio stations to receive.

You could use galena and the diode with a switch to compare. Fools gold plus a low pressure cats whisker also detects. Found in toy science and souvenier stores.
I have a chunk of each. It is still amazing to get radio out of a rock!

2nd the 1N34a. Much easier than finding a sensitive spot on a chunk of galena. We lived 20 miles from the nearest AM station and it was a 5 kw station. Not very strong. A long antenna and good ground are required.

I like the idea mentioned here of a switched detector, so you can find stationbefore having to find the mineral spot. My voltage doubler delivers more audiobut maybe too complicated to make a good demo set. On the comment onloud audio, this kind of amazes me. I have lived in major metro areas andnever heard audio of any threatening level from a crystal radio. In my area,there is a 5 kw and a 1 kw and they both have homes within a couple hundredfeet of the tower. Now, that might be a loud signal! In fact, if i lived that close,i'd have some RF harvested to power 12 volt lighting. In this area, i can get onlythese 2 stations and the local NOAA coast conditions broadcast on 1640. I do miss the much better variety of programming in the big cities.One suggestion which makes life much easier for the from-scratch builder:get an inexpensive LCR meter.-Hue

I have a grid dip meter too, so between the two I can calculate L.

Some of the early crystal sets used a single coil with two sliders. As I recall one end of the coil goes to ground, one slider to the antenna and one to the capacitor/detector. Once you found a signal you could adjust the antenna slider for highest volume. There is some interaction. Some used a movable primary coil so you could adjust coupling, more coupling for a stronger signal, less for better selectivity.

Have Fun,
Barry

The piezo earpieces are very sensitive and offer great value for money. IF you have really good
strong signal, i found that walkman-type earphones can be used with a stepdown transformer.I used a 1.5 volt "AC adapter" type transformer, of course with the rectifier removed. the crystalset output leads are soldered to the AC adapter's wall socket plug spades. I like the "found item" looks of this setup, including the mineral detector. But the piezo pieces are definitelybetter working. The transformer is not particularly efficient either, i suspect. Also the DCcomponent of the output signal is loaded by the DC resistance of the transformer, so thetuning is more broad than with the piezos. I find that to be true with all magnetic type phones.-Hue

I love that description of homebrew CD tuning capacitor. That is so do-able!
I also have been searching for things to make from excess CDs. I was thinkingof an article, "Eleven Things To Do With Kevin Trudoe CD's "They" Don't WantYou To Know About". (I inherited an album of about 10 of these BS CDs.)One of my co-workers said to hang them up around our garage; they'd frighten off the birds and no more bird poop on my truck window. It didn't seemto be working and one day i walked outside and happened to see a starlingperched above my truck, watching a CD spinning in the wind, fascinated.-Hue

Ya talked me into it. Here's a shot of a two slider crystal set I built many years ago for my grandson. That's his name engraved in the front right corner. Unfortunately, I never got him interested in radio, so it's been sitting on the shelf in my shop for nearly 30 years. Oh, those stripes on the coil are not the windings. It's a moire' effect from the lighting.

I wanted to try building a self resonant coil just to play around for the next couple of days. The calculator gives 45 turns on an oatmeal carton to get 280uH and resonance at the bottom of the broadcast band with a 365pF variable. How many turns for a self resonant coil on the same coil form at the same frequency?

Thanks,
Chris KQ6UP

You said you had a grid dip meter. In that case you can see where the coil resonates without a capacitor, and, judge from there. Since you do not have an L meter, an old Q meter like the 160 or 260 would really be handy. 73 – Mike

I have been saving ideas and parts for crystal radio heavy on "found items"parts. The detector, or one of them, will be a blue blade. The whiskerdevice will be a pencil ground down in a pencil sharpener to about 1.5inches length (already done that particular 'proof of concept' !) withthe end sliced to expose the carbon core and wrap a wire. The coilwill be an oatmeal box wound with some homemade Litz which willjust be 6x24 twisted pairs i have plenty of. The tuning cap will bethe green tea can sliding into a green tea plastic bottle. ("matched").I might roll some series tuning caps and a filter cap out of alu foil andclear plastic sheet material. I was even thinking of homemade earphonesusing piezo chunks in little spice containers. I tried snuff containers(no, i do not use that) but couldn't clean off the label. This crystal radiowill be "highly visual". I was going to call it the "Hillbilly Special" but i'mwavering now. I don't know if that name would be celebrating ourdiversity or making fun of a minority group. Oh, yeah, i cut an imageout of magazine ad from Verizon. I think it shows a stylized towerwith a wave coming off it, and says something like "Rule the Airwaves".
That will get pasted on the "chassis", which is a sawed from a boardoff a pallet. Total cash value of parts, about nil.-Hue

Re the piezo home-made headphones- interesting concept, but I suspect that the sensitivity would be far too low to be practical. As I recall, it takes a fair amount of voltage to induce a piezo crystal to distort.

Somewhere on the web there is a calculator page for Tesla coil secondary self-resonant frequency. I used it when I built a Tesla coil a few years ago. I see no reason it wouldn't work to calculate the self-resonant frequency of any large inductor, but you'll have to make the "top electrode" vanishingly small - this is, IIRC, a required input.

From: Barry Williams
Topic: 3876 Message: 13122

I am waiting for the regulator tubes. In the meantime I have decided to duplicate the high frequency oscillator used in the AGS/FB series National receivers. That way I can use HFO coils based on the band spread coils of the receivers. The oscillator uses a small value capacitor 2 to 5 of to couple to the mixer. I will couple it using the same size cap to a 2nd 24A set up as an rf amplifier. The 24A normally used 180 volts on the plate and 90 on the screen. These regulators are 90 volts, so I will use two in series. I will try keying the second 24A. I will run this from a National dog house supply. I will put a 500 watt load in the same outlet as the supply and switch it to get varying output from the supply, this would stand in for the rest of a 100 watt transmitter. The output of the oscillator will go to my scope and counter.

Hopefully I can drive an 865 to several watts output with this oscillator. This could then drive a 100 water. Either 211 or 860. It may require a 10 or 45 to get the output to drive the 865.

I realize that 100 watts disqualifies this from BK. But I expect more than 10 watts would be required from south Texas to the Northeast.

What would you do to get the most stable 1929 transmitter?

I guess you like older women Larry, HI.

Reminds me of when I lived in Florida. From mid-1974 to mid-1976 when my new bride and daughter moved to Sarasota as I accepted a position there. So, at the time I was almost 29 when we got there and moved to VA when I was almost 31. Met a lot of neat old hams down there. I remember this one old ham, was probably in his mid-60's at the time, but, certainly a lot older than I was, who had a problem with his 2 meter rig. By then I sort of built up a god reputation of being a collector and an engineer who could fix things. So, he brought over his 2 meter rig, and, I was able to fix it for him. We started talking about old age. I remember him telling me that he realized that he was getting older when more and more grandmothers looked sexier and sexier. Being pretty young then, I did not really appreciate what he was telling me. Now, that I am close to 69, I know exactly what he meant.

GM Chris

I know the feeling well. Last winter I was trying a Type 10 tube in the old Hartley. I then replaced it with the usual Type 45, but forgot to change the filament voltage. Saw a nice flash and realized what a fool I was. We are supposed to "live and learn", but I think some of us just live.

This too shall pass.

That is a very, very baaaad feeling!!!
I too, have experienced some of those "how in the h#ll did I do that?" moments.
I brilliantly forgot to reduce the filament voltage, after replacing a "841" with a "46", in my MOPA. The filament didn't evaporate, but it lit up a lot brighter than its normal dull red color, for a few seconds, before I pulled the plug! After that, its cathode emission was way below norm, as the oxide coating had apparently vaporized, and migrated to other parts of the tube.

Unfortunately, that is very far from being the only brain dead stunt, that I have pulled!

Ron,

A few years ago I did the same thing, with a pair of 45s in the PP TNT,
with exactly the same result! :-(

13139. Museum collection of historic radio equipment about to be dumped. Can it be saved?

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-05-07 18:11:47 UTC
From: Donald Chester
Topic: 13139 Message: 13139

The following message was forwarded to me from Jerry Proc
VE3FAB (E-mail: jerry.proc@...
Web: http://jproc.ca)

This is a distress call to all enthusiasts of radio and
radio history. The Radio Museum of Québec located in Sorel, Québec is in deep
trouble. Some time ago , they had to vacate the existing premises where the
radio collection was located. All artefacts were put into storage but no
suitable site was ever found. Now the owner wants his tractor trailers back,
all six of them.

The message below, sent a few weeks ago, did not result
in a solution to save the radio collection at Musée Québécois de la radio inc.
If a solution is not found within the next few days, the complete collection
will go to the trash and will disappear at the end of the month. The collection
is impressive. It contains over 1900 pieces of radio equipment and over three
quarters of a million pages of documentation. The collection is presently
stored on 130 pallets in six 53-foot trailers. The trailers are on loan and
must be returned on the 31st of May. If storage space is not found, the entire
collection could end up in the landfill. It was impossible to find a temporary
warehouse for the collection. One solution was to purchase three or four used
53-foot trailers but the fund raising attempt did not generate enough funds.
That option would have required at least $7,500.

Does anyone have any suggestions ? If no solution is
found, can we save the collection by offering it to other museums in Canada?
What to do on the 31st of May ? Open the trailers, let anyone take anything
they want, and let the rest go to the dump? Return the trailers to the owners
with the collection inside? The owner will certainly take the collection to the
dump and invoice the Museum for the cost of disposal.

Here are the options:

Find a storage solution before the end of May

Donate the collection to other museums (must be picked up
before the end of May)

Let anyone take what they want and send the rest to the
dump

Send the entire collection to the dump

Abandoning the collection by returning the trailers with
the collection inside

If you have any suggestions, or if you can help, please
contact Jacques Hamel, VE2DJQ at: museeradio@...
Sorel-Tracy is within 75 kilometres (47 mi) of both Montréal and
Trois-Rivières, and is easily accessible via Autoroute 30 from the west and via
Route 132 from the east and west.

A similar situation arose in Adelaide, South Australia
two years ago when a local Council refused to renew an Aircraft & Radio
Communications museum building lease because the dated building (owned by the
Council!!) did not comply with 2012 Workplace Health & Safety Regulations.
The cost of any alterations was expected to be borne by the museum; same
situation: not enough funds raised to do that. The outcome was that the museum
was closed on the due date; the museum committee contacted other museums around
Australia plus authentic amateur radio clubs & some ''selected
individuals'' (so items did not finish up on eBay!!) & as many items as
possible were dispersed that way. The remainder was dumped. That was the second
wireless/radio/communications museum in this State to go that route. The
Postmaster Generals Department wireless, signalling & communication museum
right in the middle of the Adelaide CBD was evicted due to property demand. The
collection was broken up with most still stored in a caring individual's
warehouse some 20 years later.

You don't need solder. That can be added when the connection is soldered. Just use a drill bit of the size hole you need and wrap it with a length of tinned, bare wire about # 20 or 22. Cut to desired length.

13144. Scala Oscilloscope Probes

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-05-12 23:27:23 UTC
From: Dale H. Cook
Topic: 13144 Message: 13144

Several years ago at an estate sale I purchased four Scala oscilloscope probes from the 1950s:

B. Z. -1 Signal Tracing
B. Z. -2 Low Capacity 10:1 Voltage Divider
B. Z. -3 100:1 Voltage Divider
B. Z. -4 Voltage Doubler

They were all in the box that the B. Z. -1 came in, with the instruction sheets for that probe. They are in pretty good condition, with the decals mostly intact. No 'scope cable was included, but I can make those as I have plenty of matching connectors and vintage coax. One ground lead is missing, and the ground lead wire on two others is hard, but I can fix all of those that with a spool of probe lead and a spare matching alligator clip from my parts drawers.

These probes are shown in:

Bruno Zucconi and Martin Clifford, "Probes" [Gernsback Library Book No. 54] (New York: Gernsback Library, Inc., 1955). Zucconi was the president of Scala.

Does anyone have the instruction sheets for the other three probes? I would love to have high-resolution scans for those, and I can scan the B. Z. -1 sheets into a PDF if anyone would like a copy.

13146. Re: NYPL - SIBL Library - anyone research there?

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-05-17 01:24:42 UTC
From: kd4hsh@...
Topic: 13061 Message: 13146

Well happy (eventually) conclusion to my quest for info from the NYPL.

You register (free) and then you can bring up a form where you can enter your search request. A non-commercial research only request is a basic $25 for up to 50 pages sent via e-Copy.

Then you simply click submit and eventually find out that nothing happened (my experience).

So sending off an e-mail gets me a prompt reply from a real person... I'm told the system is working OK and they were not able to figure out what I had done to prevent the request from being processed. So I give them my request in a reply e-mail.

The next day I get notice that the document has been located and please remit. I do it by credit card. The next day I get a URL and pass word where I can download the .pdf scan...

So... There is a way for a geek out in the boonies to get info from a big city library institution (at least in this case).

My thanks to Alan Douglas who had a follow-on article in his library that helped me to determine what issue I needed to have NYPL search for my article.

"Heathkit Test Equipment Products" by Chuck Penson Wa7ZZE.

It's an amazing book about Heathkit test equipment products and follows his first book, "Heathkit: A Guide to the Amateur Radio Products" published a number of years back.

It is available from amazon.com for $19.95 plus $3.99 shipping.

Don't have one of these, and they're quite rare in the U. S. (not exactly common in Britain either).

As for equivalents, a plug-and-play replacement is a Fuggedaboudit, what with the special base. Electrically, the XSG is a 1.5-volt (@ 80 mA) sharp-cutoff tetrode with a modest gm of 300 micromhos, vaguely comparable to a 1L4 miniature pentode. The XY is an output pentode (1.5 V @ 160 mA) crudely like a 1S4 miniature.

I have both the Ham and Test equipment books. Great books. I met Chuck at the MAARC meet near Washington DC a couple of years ago. He is a very nice guy and a pleasure to talk to. I enjoyed his speaking presentations at that meet very much. Maybe he can get on the “speaking circuit” and do a presentation on the test equipment.

13163. Item on reflector

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-05-23 01:33:18 UTC
From: Joe Koester
Topic: 13163 Message: 13163

A few weeks back someone posted an article and/or a link for a device to substitute for a field coil and also for an output transformer for old radios. Essentially eliminated the need for the original speaker while servicing the radios.

Nice project box loaded with resistors and switches.

I saved this somewhere on the computer and now I can't find it.

Can someone point me to the article?

Thanks,

Joe

Joe,

I don't recall, hopefully someone will. I substitute a 10H choke w/100 ma rating for the field coil and use something like 6 to 8 k primary to 8 ohm output transformer and modern 8" speaker. You might run into a case with push pull audio, like a pair of 45s. Then you would need a center tap on the primary. Single ended, just don't connect the center tap. Antique Electronic Supply can fix you up, you may save money by checking with Gary at Playthings of the Past. He is very helpful.

Sometime this summer I hope to expand it to handle sets with dual field coils, a tapped field coil, or field coils with higher values than the current system can handle. The hard part will be finding a cabinet that I like - the Radio Shack 270-253 was discontinued years ago. I would love to find a few of them as NOS, as it is a pretty nifty cabinet and I would like any additions to the system to match what is already there.

13179. Source for battery potting wax?

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-05-26 13:32:38 UTC
From: kd4hsh@...
Topic: 13179 Message: 13179

Some of you may know that I have an interest in preserving and replicating batteries that were absolutely essential in the early days of radio and have virtually all been lost due to the disposable nature of the product. (Especially those made before about 1927.)

I have been able to replicate the red and black potting waxes using urethane plastic casting resins with pretty good results, but I'd still like to use original materials.

The materials used back in the day had to be cheap. Do you know of a modern source of such materials?

The only hard waxes I have found are for sealing letters and other documents as in the old days... To pot the top of a 45 Volt battery, it would cost maybe $75 worth of sealing sticks!

Then there are hard waxes for lost wax casting. These waxes are color coded and seem like they would not lend themselves to getting a good red oxide coloring.

I have seen references to a Zophar Mills, Inc. in Amityville, NY but they don't have a web presence so don't really know if they have any knowledge of such potting.

Comments welcome,
Robert

Robert, I have a large block of potting wax here that you're welcome to. It was found in a box of electronics equipment from the 1940s. I'd be happy to send it to you if you pay the shipping cost. I can take a photo of it if you'd like to see that.

Hello Robert,

You might do a web search for machinable wax and homemade machinable wax. Machinable wax may be made by melting paraffin wax and a plastic such as grocery bags or bottle tops. You may be able to add a color from crayons or powdered cloth dyes. Wallmart has paraffin for about $3 a pound.

Chris

Robert -

Although it was still called sealing wax in Colonial times by that time letter sealing wax generally contained no wax. The sealing wax of the European middle ages consisted of beeswax and a hardener which was generally some type of tree resin, plus a natural coloring agent such as cinnabar (the source of the vermillion pigment in old oil paint). Well before Colonial times the formula had changed to one consisting largely of shellac and resin, with filler such as plaster of Paris or powdered chalk added for strength and opacity. I would expect that vintage electronic potting compound is similar to the latter type of letter sealing wax. I don't think I have any vintage potted electronics that I could sacrifice to chemical testing, and it has been 40+ years since I studied chemistry so I probably wouldn't be too good at testing it anyway. Although I have some vintage letter sealing wax the same goes for me testing it. You might investigate the formulas used for letter sealing wax to see if you can replicate it. I would expect that the filler is what was colored to color the "wax."

the Eastern/Greek Church still uses beeswax plus a resin hardener to make small give away crosses as a remembrance of a visit to the Ecumenical Patriarch (the top cleric of the Orth. Churches; just met with Pope in Israel) and it has a pleasant odor and is quite hard. Don't swear by it dielectric constant though. Try a hobby store for candle making wax; two kinds, one that burns and one that forms the outer wall, which has a much higher melting point. The hi temp kind may work OK on small projects that wont get very warm. 73

Robert -

Although it was still called sealing wax in Colonial times
by that time letter sealing wax generally contained no wax.
The sealing wax of the European middle ages consisted of
beeswax and a hardener which was generally some type of tree
resin, plus a natural coloring agent such as cinnabar (the
source of the vermillion pigment in old oil paint). Well
before Colonial times the formula had changed to one
consisting largely of shellac and resin, with filler such as
plaster of Paris or powdered chalk added for strength and
opacity. I would expect that vintage electronic potting
compound is similar to the latter type of letter sealing
wax. I don't think I have any vintage potted electronics
that I could sacrifice to chemical testing, and it has been
40+ years since I studied chemistry so I probably
wouldn't be too good at testing it anyway. Although I
have some vintage letter sealing wax the same goes for me
testing it. You might investigate the formulas used for
letter sealing wax to see if you can replicate it. I would

expect that the filler is what was colored to color the "wax."

Hi Robert. I'm also interested in replicating old batteries, mainly Burgess batteries. I had a number of scans that I downloaded from the web but I lost them all when my computer crashed & burned a couple of years ago, Since then I have been unable to find the site where I found the scans. I've found plenty of Eveready scans but only a couple of Burgess scans. As for sealing wax, I have a formula that calls for shellac, turpentine and cinnabar, with venetian red for red wax. Black is a little more involved.

Leonard

Some of you may know that I have an interest in preserving and replicating batteries that were absolutely essential in the early days of radio and have virtually all been lost due to the disposable nature of the product. (Especially those made before about 1927.)

I have been able to replicate the red and black potting waxes using urethane plastic casting resins with pretty good results, but I'd still like to use original materials.

The materials used back in the day had to be cheap. Do you know of a modern source of such materials?

The only hard waxes I have found are for sealing letters and other documents as in the old days... To pot the top of a 45 Volt battery, it would cost maybe $75 worth of sealing sticks!

Then there are hard waxes for lost wax casting. These waxes are color coded and seem like they would not lend themselves to getting a good red oxide coloring.

I have seen references to a Zophar Mills, Inc. in Amityville, NY but they don't have a web presence so don't really know if they have any knowledge of such potting.

Comments welcome,
Robert

I'm about ready to crash and burn for the night... I do have a couple of Burgess scans I can share with you.

I too saw some of the recipes for sealing wax. Seems like shellac would have been too expensive to put into potting compounds for disposable batteries.

More later,
Robert

Robert -

The waxes that I am familiar with would seem to have too low a melting point to be a major part of battery potting compound, but I don't know what the melting point is of the combination of paraffin and polyethylene. Of course, back in the day they didn't have polyethylene. Of course, I am familiar with very few waxes.

If a wax was a major constituent of battery potting compound (which was probably similar to other electronic potting compounds) it was certainly an artificial wax. A possibility is one of the waxes from Halowax, a company eventually purchased by Union Carbide. The Halowax compounds (which are still manufacured) are polychlorinated napthalene (PCN), and as the chlorine proportion is increased the PCN moves from waxy to solid at room temperature. I see online that PCNs were in production in the US for high-volume uses by about 1910. My oldest copy of Ghirardi's "Radio Physics Course" is the 1933 5th impression of the second edition, and it lists two Halowax products in the dielectric resistivity table in article 29. When I find some time I may have a chance to check other electronic and electrical reference works in my library to see what I may find.

Robert, the scans I have were for replicating the batteries. I simply printed them out and glued them onto the battery box. The only one I can't find now (as far as I know) is for the #6 dry cell. Normally, I don't have a problem sending pictures with this group, but I'll send an example to your email address.

Dale,

Nice detective work.... Little tidbits I did not know.

I think I'll send an e-mail to Zophar Mills to see if anyone there knows about the history of potting compounds for high volume battery production....

Also it just occurred to me that there was an Eveready (?) plant somewhere west of Charlotte, NC that made high voltage batteries for military radios up into at least the 1970s. Maybe there is an old timer in the area that remembers?

Robert, it just occured to me that you could use fiberglass resin, the kind used for surfboards. The resin comes in a clear form, but can be colored to any shade you want. If you made a rubber mold of the battery top, you could "mass produce" the tops. Add a little milled fiberglass for strength and there ya go. I've used this to reproduce knobs and dials for some of my projects and you can't tell them from the original.

From: Barry Williams
Topic: 13193 Message: 13193

All Electronics (I'm not affiliated) has 48 volt by .436 amp switching supplies for $5.50 each. I've connected three of these in series to get 48, 96, and 144 volts. From the same place I got 22 volt 5 watt zener diodes.

I have placed loads up to 150 ma on this supply and regulation is very good. There appears to be about 100 MV of noise on the output. I will add a couple of capacitors to get rid of most of the noise. The zeners would allow outputs of 22v, 48v, 70v, 96v, 118v, and 144 volts.

The outputs are isolated from ground, the supplies are in a totally enclosed plastic case with IEC connector and cord. Once I dig out a battery set I will let you know the results of using this power supply. I just wanted to let everyone know while there are still cheap 48 volt supplies available.

Robert,
I would try Gilsonite: I was introduced to this wonderful fossil asphalt a few years ago when I had to go to NE Utah to put out a forest fire. Gilsonite (trade name) or Uintaite is a fossil asphalt only found in that section of Utah. It looks like coal, is lighter, and melts easily. The material looks a lot like the potting in old Model T spark coils. Here's a link to the history of Gilsonite: http://en.wikipedia.org/wiki/Gilsonite I found quite a bit of it while I was out there. Industrially, I think it sells for between $1-2 a pound. American Gilsonite still mines and sells it. You can probably get a sample from them, or I can drop a lump of it in the mail to you. I don't know if you can melt and use it as the pure product, or if you may want to melt it with something like paraffin wax to create a product with a lower melting point.

Hi Tom,

Another tidbit I did not know... It so happens that I encountered what surely is that material inside a 0.25 Mfd. bathtub condenser last month. Jet black and glossy, thin layers will crack like glass at room temp. I have also encountered European radios of the 30s where they insert tubular caps into glass tubes and plug with the stuff in each end.

BUT, I'm pretty sure that is not used in the red 'stuff' in the tops of 20s vintage radio batteries....

The quest continues.

ELECTRICAL THEORY BY JOSEPH LUCAS

Positive ground depends on proper circuit functioning, which is the transmission of negative ions by retention of the visible spectral manifestation known as "smoke".

Smoke is the thing that makes electrical circuits work. We know this to be true because every time one lets the smoke out of an electrical circuit, it stops working. This can be verified repeatedly through empirical testing.

For example, if one places a copper bar across the terminals of a battery, prodigious quantities of smoke are liberated and the battery shortly ceases to function. In addition, if one observes smoke escaping from an electrical component such as a Lucas voltage regulator, it will also be observed that the component no longer functions. The logic is elementary and inescapable!

The function of the wiring harness is to conduct the smoke from one device to another. When the wiring springs a leak and lets all the smoke out of the system, nothing works afterward.

Starter motors were considered unsuitable for British motorcycles for some time largely because they consumed large quantities of smoke, requiring very unsightly large wires.

It has been reported that Lucas electrical components are possibly more prone to electrical leakage than their Bosch, Japanese or American counterparts. Experts point out that this is because Lucas is British, and all things British leak. British engines leak oil, British shock absorbers, hydraulic forks and disk brake systems leak fluid, British tires leak air and British Intelligence leaks national defense secrets.

Therefore, it follows that British electrical systems must leak smoke. Once again, the logic is clear and inescapable.

In conclusion, the basic concept of transmission of electrical energy in the form of smoke provides a logical explanation of the mysteries of electrical components especially British units manufactured by Joseph Lucas, Ltd.

And remember: "A gentleman does not motor about after dark!"

From time to time I am adding to my site descriptions of some of the projects that cross my bench. This one is not an antique radio (but some of the equipment used to work on it, such as my GR 805-C standard signal generator, is older than some of my radios), but I thought some of you might enjoy looking at it. It is the largest and heaviest device-under-test that I have ever had in the shop - the second of two Harris RT-1446 military HF transceivers that I have been working on. They were state-of-the-art 30 years ago and are still pretty impressive:

FLASH!

USCG WILL PARTICIPATE IN NIGHT OF NIGHTS!
NEW USCG STATION ON THE AIR!
KPH, KFS, KSM, WLO AND KLB WILL BE ON THE AIR!

Event Date: 12 July 2014 Pacific Daylight Time
First Transmission form MRHS Stations: 5:01pm Pacific Daylight Time 12 July, 0001Z 13 July 2014

> Historic coast stations KPH, KFS, KSM, WLO AND KLB will return to the air

> RCA "H Set" Transmitter 298 will be on the air

> 1942 Press Wireless PW15 transmitter will be on the air

> USCG Coast Stations NMC, NMQ and NMW will be on the air

> K6KPH will be listening for calls and signal reports

> Join us in person or on the air!

But wait, there's more:
> Marconi author Calvin Trowbridge Jr. book talk and reception

> Fantastic exhibit at Bolinas Museum for 100th anniversary of Marconi operations

> Listen to "An Ode to Morse Code", the story of Night of Nights

> MF antenna filter saga

> Preserving the RCA BL298H set transmitter with heat

Clearly we have a lot to cover in this issue. But before we dive in we'd like to solicit your support for our activities like Night of Nights and the ongoing maintenance and repair of the transmit and receive stations and their associated antenna fields. Any donation you can make will be very deeply appreciated and will go directly to support our efforts. Just click on the button below.

Make a Donation

Thanks!

Night of Nights 2014!

Morse code...

It's just beeps in the air. Yet on 12 July 1999 some very tough looking grizzled old radio pioneers had tears in their eyes as the last commercial Morse code radiogram was sent. It was the end of an era. And as the last beeps faded away into the static they witnessed the end of the career to which they had devoted their lives.

These men - and some women - had stood watch over the airwaves on shore and at sea. Theirs was mostly the business of maritime commerce. But when their ship was in peril they were called upon to send the most electrifying three letters in radio, S O S , knowing that all their fellow radio operators would press their earphones close to get every scrap of information and bring aid to their stricken ship.

Once, our coasts were dotted with great Morse code radio stations, all communicating with ships at sea. They're all gone now... all except one, the one they called the Wireless Giant of the Pacific, located at Point Reyes.

On that sad day in 1999 another event took place. The Maritime Radio Historical Society (MRHS) was formed. We made it our life's work to honor the men and women of wireless by restoring that wireless giant. One year and one minute later the giant's voice once again spanned the oceas as we picked up the thread and kept the faith with our colleagues of the air.

Every year since, in an event that became known as the Night of Nights, Morse code station KPH has returned to the air, joined by KFS and the station of the MRHS, KSM.

This year our friends and colleagues at USCG station NMC have labored mightily to bring that storied call sign back to life on Morse code for the evening along with NMQ in Cambria, CA..

And, for the first time on Night of Nights, station NMW in Astoria, OR will be on the air as well.

Stations WLO and KLB will join us again as hey have in years past.

This is a global and local event. Hundreds of listeners around the world will be waiting with their earphones on, waiting for the signals of the great station to once again arc

over the dome of the Earth to their receivers.

You can be with us in person!

Dozens of people will join us at the RCA receiving station in the Point Reyes National Seashore to watch as the signals are transmitted by hand using vintage telegraph keys.

A guest operating position will be available so bring your key and 'phones or use ours and operate K6KPH. No license required! So if you're an ex-commercial op who never became a ham here's your chance to sling some Morse again. Or if you hold a current commercial radiotelegraph ticket you can operate KPH, KFS and/or KSM and have your license endorse to that effect.

Chief Operator Richard Dillman at Position 1

Date: Friday 12 July 2014 Pacific Daylight Time

Location: RCA receiving station, 17400 Sir Francis Drake Blvd., Point Reyes National Seashore

Click HERE for a map of the location from Google Maps

Time: Doors open at 3:00pm pdt, first transmission 5:01pm pdt (0001gmt 13 July)

Refreshments: Served

Photographs: Encouraged

Tours: Given

None of this would have been possible without the trust and vision of the Point Reyes National Seashore . The only reason these facilities were spared the bulldozer that visited all the others is that they are on park land. And the only reason they have been restored to operation is that the PRNS staff understood their importance and trusted the MRHS to restore them to life.
  We will send last minute changes and signal reports by Twitter. You can join Twitter free at:

https://www.twitter.com

and follow us at @Radiomarine

MRHS Stations

Sixteen transmitters will be on the air from the MRHS transmitter site in Bolinas. That doesn't include transmitters held in ready reserve in case of failure. Members of the crack MRHS Transmitter Department and the H Set Team will be on hand to assure that all goes well.

> KPH:

Frequency	Transmitter	Antenna
500/426	Henry MF-5000D	Marconi T
4247.0	RCA K Set	Double Extended Zepp
6477.5	RCA K Set	Double Extended Zepp

8642.0	RCA L Set	Double Extended Zepp
12808.5	RCA L Set	H over 2
17016.8	RCA L Set	H over 2
22477.5	RCA H Set	H over 2

The restoration of the H set has been chronicled in past issues of the Newsletter. It will return to revenue service for the first time in decades for Night of Nights. See Newsletter No. 38 for information about and photos of this magnificent transmitter.

> KFS

We want to offer our sincere thanks to Globe Wireless for the help and support they have provided for our project since the very beginning.

21050.0	Henry HF-5000D	H over 2

> Reception Reports

Reception reports and verification requests for the MRHS stations listed above may be sent to:

Maritime Radio Historical Society
PO Box 392
Point Reyes Station, CA 94956
USA

> Station Telephone

The receive site may be contacted by phone on 415-669-9646

USCG Stations

NOTICE!

This may very well be the last time ever that USCG stations can be heard on the air using A1A (Morse) emission. As new equipment is installed the hardware and wiring for Morse has been progressively removed. And the personnel who knowledgeable in the art retire or are reassigned. So be sure to listen for these stations.

Many USCG personnel at all levels are responsible for bringing these stations back on the air for Night of Nights 2104. We want to particularly thank ET1 Mike Leska for taking the lead for this year's project.

NMC/NMQ verification card from Night of Nights 2014

> NMC (Transmit Bolinas, Receive Pt. Reyes)

Via email (for both stations) to: wloradio@...

> Calling Channels

All commercial and USCG stations listed above will listen for calls from ships on 500kc and on ITU Channel 3 HF:

4184.0
6276.0
8368.0
12552.0
16736.0
22280.5

Listen on these frequencies if you want to copy both sides of ship to shore contacts.

> Commemorative Messages

Was your father, uncle or grand dad a commercial op or amateur operator? Would you like to send a commemorative message in their honor over KPH, KFS and KSM? We have sent several of these messages in past events and they were all very moving. If you would like us to send such a message this year please send it to us no later than Wednesday 9 July pdt so we can be sure to include it. Sent it to info@...g

> Marconi author Calvin Trowbridge Jr. Book Talk and Reception

Make it full weekend of radio with this event the day after Night of Nights

Date: Sunday, July 13
Time: 2 pm to 5 pm
Location: Red Barn Classroom at Bear Valley.   Directions.
Phone: 415-464-5125

Description: Meet the author of Marconi: Father of Wireless, Grandfather of Radio, Great-Grandfather of the Cell Phone, The Story of the Race to Control Long-Distance Wireless. He will speak about Marconi's empire building, the competition and patent wars, and the fast pace of invention and technology change as the potential for radio became understood in the early 20th century. Books will be available, enjoy a chat with the author and complimentary refreshments.

> Fantastic exhibit at Bolinas Museum for 100th anniversary of Marconi operations

The Marconi trans-Pacific stations in West Marin went into service in February 1914 with a transmit site in Bolinas (still in use today) and a receive site at Marshall.

Carola DeRooy of the Point Reyes National Seashore and Jennifer Gately of the Bolinas Museum combined efforts with many other to produce a truly wonderful exhibit at the Bolinas Museum commemorating this event.

Marconi & Sarnoff at Rocky Point, tube display including water cooled tube, submarine spark transmitter on display

The exhibit includes a great display of power tubes, the submarine spark transmitter donated to the MRHS as described in Newsletter No. 41 , a great assortment of keys and bugs, an IP501A receiver and much more.

The museum is located at 48 Wharf Road in Bolinas. The hours are Friday 1:00 - 5:00, Saturday 12:00 - 5:00, Sunday 12:00 - 5:00

Richard Dillman, Carola DeRooy and Denice Stoops at exhibit opening

> "An Ode to Morse Code", the story of Night of Nights

Julie Caine is a producer at public radio station KALW in San Francisco. In 2013 she produced a wonderful radio program about Morse code and Night of Nights.

Click HERE to listen to "An Ode to Morse Code".

> MF antenna filter saga

KSM uses a Marconi T antenna for MF reception. This is a great antenna - almost too great as it pulls in all sorts of broadcast signals. Plus it feeds a house made preamplifier that can be easily be driven non-linear by strong signals. To prevent problems there is a selectable frequency filter at the base of the antenna that's remote controlled from Position 1. The filter and its housing served well but eventually the salt air took its toll. That's where Bill Ruck of MRHS Maintenance stepped in. He rebuilt both the filter and the case. Let's listen now as we hear Bill say...

KPH's MW receive antenna at RS has for a long time been a "Marconi T" antenna.

The problem with maritime band MW reception is that just above the maritime band is the AM Broadcast band with many high power (mostly 5 kW and a few 50 kW) stations nearby. A good maritime MW receive antenna is also a good broadcast MW receive antenna.

The KPH home-built MW multicouplers overload from broadcast stations so a filter was added to the receive system to allow good maritime reception without overloading.

The filter assembly had five fixed frequency series L - C filters plus a direct selection connected via a 6 pole single throw coaxial relay. This relay is commonly used at RS for receiver input selection from the SW multicouplers.

The assembly was housed in a galvanized steel box on the pole at the feed of the "Marconi T" antenna in what used to be the "C" antenna field.

The first experience with the filter was when the Operations Department complained that one of the filters did not work.

A trip to the antenna and filter was in order. I found the box, pried the lid off, and removed the relay / filter assembly. Back at RS it was easy to spot the bad filter because there were two wires in mid-air and no capacitor. Likely a nearby lightning strike had blown apart the small capacitor. An identical replacement was found in the shop, installed, and the filter frequencies adjusted with a spectrum analyzer and tracking generator.

Re-installing the filter I added single pole Molex pins and sockets so that the relay / filter assembly could be removed without field soldering. At that time it was readily apparent that the galvanizing had worn off and the bottom of the box was mostly rust.

This worked for a couple of years until again the Operations Department complained that one of the frequencies did not work. In the field one could see that about half of the bottom of the galvanized steel filter box was missing. The relay / filter assembly was removed and returned to the shop.

Filter box and filter as found

This time the cause was sufficient rust on the relay clappers to restrict the motion sufficiently so that the contacts were never pushed together. The rust was filed off of the clappers, the contacts were good, and the relay / filter assembly was returned to the box. An attempt to seal the box with 2" wide 10 mil black tape was made, although it was hard to get the tape to stick to the box.

A couple of months later again the Operations Department reported one of the frequencies did not work. In the field the tape had fallen off, more of the bottom of the box had rusted out, and rust and corrosion was evident inside on the relay / filter assembly.

Original filter assembly, rear

The assembly was returned to the shop. The rust on the relay clappers was filed off again and this time a coat of clear nail polish was applied to slow down the rust. Once the polish had dried the assembly was returned and all filters worked.

It was clear that this design was at the end of its life. Many discussions were held to determine the course of replacement. One idea was to replace the switched single frequency filters with a single fixed low pass filter; perhaps with a second notch filter to remove the high power broadcast stations near the bottom of the dial.

The Operations Department wanted to keep the historical fabric intact even though there are clear advantages to the fixed low pass filter.

Ye Olde Junque Boxe was scrounged for parts. I found six 24 VDC single pole NO reed relays. Reed relays have the advantage that the contacts are totally sealed in a glass tube. They can not handle much current, but they would be more than acceptable for a receive application.

We also had saved parts from the KMI antennas when they were cut down and found from that salvage a good fiberglass water-tight box with feed insulators in the shop.

The plan was to fabricate a whole new filter assembly and replace the rusted out box and rusted and corroded relay / filter assembly.

Two enhancements were added. The first was a static drain choke. The "Marconi T" antenna is either floating when no relay is selected or DC isolated when a filter is selected since the filter is a series L - C filter. Surplus Sales of Nebraska had an appropriate coil that could be used as a static drain choke.

The second enhancement was a spark gap external to the filter box. A suitable gap was fabricated from ¼-20 brass all-thread mounted to the antenna and ground insulators.

Five new adjustable inductors were also purchased from Surplus Sales of Nebraska for the filters.

The relays and filters were fabricated on an aluminum plate that would mount internally in the fiberglass box. Since the reed relays are sealed inside of the coil it is impossible to observe them LED status indicators were added showing which relay had +24 VDC.

The relay coil DC connections on the existing filter assembly were with the standard RS style S-308 CCT Jones plug but I wanted a connection that did not need field soldering. An 8-140 barrier strip was used so that crimp lugs could be used to terminate the control cable.

New filter assembly in new enclosure

The relay assembly had a binding post input terminal and a BNC output connector. A short BNC to N female chassis jack RG-58C/U coax cable was used to connect the filter to the outside world.

The control cable got a weather tight strain relief.

Some discussion was made over how waterproof the assembly could be. The box itself is well sealed but the two insulators (antenna and ground) could leak. The insulators were sealed with a drop of silicone RTV inside the insulator and the rubber washer was liberally coated with silicone grease but these seals may not be perfect. Finally we decided to use a vent so that if water did get in the box would not fill up with water but drip out. Hoffman makes water-tight electrical boxes and they make an appropriate vent accessory and one was purchased. A ½" threaded hole was made for the vent.

The next design issue was how to mount the new filter box. The box is designed to mount to a flat bulkhead but in the antenna field it has to mount to a round wood pole. After some thought a simple mounting bracket could be fabricated from strut. However, since the location is close to the ocean, standard zinc-plated steel strut would start to rust the

day it was installed. Galvanized steel strut is available but the cut ends would rust, even after a coat of zinc-rich "cold galvanize" paint. The decision was to use stainless steel strut. I was staggered to find out how expensive this material is but it will last forever. All of the hardware used for this project was stainless steel.

A template was cut matching the box dimensions and mounting holes. The stainless steel strut was cut to length and drilled appropriately. The mounting bracket assembly was put together and checked for dimensions.

All was tested and ready for installation.

Saturday November 9, 2013, the installation work commenced. Operations were possible by bypassing the filters although with the antenna directly connected to the coax there was a lot of IM and noise on the maritime frequencies. The old box was removed with no issues (it basically fell apart) and the new mounting bracket attached to the wood pole with ¼" stainless steel lag screws. The filter assembly bolted to the holes in the bracket. The antenna connection was made with a new lug on the down lead. The filter ground connection and mounting bracket ground connection were tied to the existing ground lead on the pole. The control cable was cut to length, crimp lugs installed, and landed on the barrier strip.

New filter mounted on pole

Then the "Welcome to KPH" moments started. Checking with Position 1 selecting various filters the relays did not work. Turns out after some head scratching I remembered that while every other relay at RS uses the black wire for DC minus the filter relay used the red wire for DC minus. In the process of sorting this out the +24 VDC got shorted to the DC minus and the fuse for that switch blew. It took a little time for Chief Operator Dillman to find the blown fuse and replace it. Now 5 of the 6 relays worked. We will return to the bad relay later.

Good engineering practice is to use Type N RF connectors but the existing coax cable had a UHF male connector so an adapter was used at the output connector. But Chief Operator Dillman reported no signals at Position 1. More investigation revealed that the box thickness was sufficient to keep the N male connector from mating properly with the N female chassis bulkhead connector. A short BNC cable was used to bridge the cap between the filter output BNC and a BNC-UHF adapter to the existing coax. Now Position 1 could hear signals. The cable and connectors were taped up to make them weather-tight as an "OK temp" solution.

The next weekend I investigated the one relay that was not working. At the relay box I could not measure any voltage on that control wire but if I lifted that lead I could measure a volt or so into my VOM. Back at Position 1 I could measure a full +24 VDC. Likely conclusion is that this wire in the control cable is broken at one point. Fortunately the control cable is a 9-conductor #18 AWG cable and we only need 7 wires. The plan is to switch out the bad wire with the spare conductor. This is easy at the filter box but the other end of the control cable is soldered to a xmas tree block which makes it hard to rewire.

On another trip a barrier strip was added at the multicoupler and relay box and the control cable was cut and terminated at the barrier strip.

By this time it was winter and the MF Marconi T feed is located at a low point in the field. It fills with water and lacking a small boat or hip waders we had to wait until it

dried out. Late rains kept the lake filled but when it dried out a trip was made to swap the wires at both the multicoupler terminal strip and filter terminal strip. The "blue" wire was swapped with the spare "orange" wire and that filter position works now.

Completed assembly

Chief Operator Dillman also reported that the 500 kc filter was not operating. When checked in the field it was working. Measuring the voltage at all six positions revealed that at five of the relays the voltage was about ½ volt higher than at the 500 kc position. At this time we suspect that the "white" wire for the 500 kc relay was going bad. This is a concern because the control cable has nine conductors. Seven are necessary. The "blue" wire is already known bad which leaves eight conductors. The "black" wire is used as a source of +24 volts that is not necessary so the "white" wire can be swapped with that wire. That leaves us with a known failing control cable and no spare wires.

We're now looking for a donation of about 500 feet of at least seven conductor #18 AWG wire suitable for outside use, something known as Out Side Plant (OSP) cable in the telephone world.

Finally we need to come up with a solid mechanical coaxial connector at the filter box. The plan is to fabricate a spacer on the outside of the box to mount a plate with the N bulkhead connector. This will allow full engagement of the N Male cable connector.

The Operations Department is prepared to stipulate that Bill Ruck is indeed a God.

> Preserving the RCA BL298H H-Set Transmitter With Heat

When we began our project the salt atmosphere in the transmitter gallery was virtually the same as that outside. The "modern" (1990 vintage) Henry transmitters had been abandoned for two years. There was standing water inside them from condensation. The classic transmitters from the 1950s had been abandoned for ten years. The controls were frozen and the doors couldn't be opened. When we did open them we find staggering amounts of rust and corrosion.

When you're running transmitters H24 as RCA did the heat keeps them moisture free. We now run the Henry transmitters only once a week, the classic transmitters even less frequently. So when the H Set Team completed their stupendous restoration of 298H they wanted to make surethe classic gem did not once again become a victim of salt air and moisture. Here's the story of how they did it, told by Greg Farrell of the H Set Team:

Superintendent Cicely Muldoon pits restored T298H on the air for Night of Nights 2013
Many of you are already familiar with the work the venerable H-set team did to restore the RCA 20 KW SSB T3 "H-set" transmitter and get it back on the air. It was a huge team effort, with countless trips to Bolinas (BL) and thousands of hours of volunteer time spent working on it, over a 3 year period. It's dedication occurred on July 12, 2013. What I will be covering in this article, is the design and implementation of a heating system, to help preserve the transmitter between operating cycles, which could be days, weeks, months, by keeping the interior hardware above dew point.
We were very conscious of the fact that the marine climate at Bolinas is tough on transmitters. After 30 years of service and 20 years of sitting idle, the salts in the air that had accumulated and precipitated where electric and magnetic fields were strongest inside while it was in operation, had turned much of the exposed metal,wiring, hardware and electronic components into corroded relics. With all the effort put into the restoration,

how could we ensure that history wouldn't repeat itself again, either in the next 10 years or next 1000 years? The work we had done was to restore and preserve a National Treasure of the Wireless Communication Age. We sure as heck didn't want to see it turning into a corroded hulk again!

The humidity on the coast at Bolinas runs high most of the year, between 80%-99%, with a dew point that runs in the mid 50's most of the time. Dew point is defined in Wikipedia, "as the temperature at which the water vapor in air at constant barometric pressure condenses into liquid water at the same rate at which it evaporates. At temperatures below the dew point, water will leave the air."

The prevailing on-shore winds off the Pacific Ocean, move tons of NaCl molecules over the land, and anything that is exposed or that moves air will get exposed continually with molecular salt. We knew we needed heat to keep the transmitter above the dew point, especially during the winter months, while it was sitting idle between operations. The RCA transmitter building 2A is not heated, and gets quite cold inside at times.

We knew we needed to get heat inside the transmitter cabinet, but in particular, heat into the sensitive RF Power Amp/Modulator Assembly. With limited funds, we needed to come up with a solution that was not only inexpensive, practical and durable, but also one with no moving parts, or parts that could easily fail due to fatigue, age or corrosion.

Several options were investigated, including high-grade commercial/industrial heaters, strip heaters, cabin heaters etc. Finding a suitable thermostat was another challenge. Most thermostats commercially available are not designed to operate indefinitely in a harsh marine environment.

On the way home one day from Bolinas, riding with Bob Dildine and Larry Nutting, I asked the question, "What if we used power resistors?" They have no moving parts. Their resistance and power (heat) output is rated specifically. All they need is electricity. Sealed, they will produce a known value of power in watts in perpetuity as long as AC current is available to them.

The thermostats selected had to be sealed, durable and able to survive the salty air. After investigating possible sources, I settled on using one made by a company named SENASYS, model 2570L334 (L-1671) . Sealed, it is designed for use in extreme environments. This particular model closed (power on) at 60 degrees F (15.5 C) and opened (power off) at 70 degrees F (21.1 C). And they were cheap! Price was $9.75 each, so I ordered two with one for back-up.

For the resistors, we selected a DALE RH-250 250W 120 OHM 5% power resistor, readily available and cheap ($7 each on eBay). They produce a nice even predictable level of heat when mounted to 3/8" aluminum plate. We decided to mount them in series using thermal compound, to operate at approximately 55-60 watts at 1/2 amp for nice, gentle continuous operation.

DALE 120 Ohm resistor   Larry Nutting, assisted me in the overall design, locating and selecting a suitable aluminum mounting plate at a local salvage yard, drilling and tapping holes, along with testing and validation prior to finalizing the design and installation. The plate had to fit the bottom of the PA assembly exactly, and its mounting holes had to align where screw holes already existed to attach the large PA bottom cover. One of guiding rules during the restoration project was to avoid unnecessary cutting or hole drilling, to keep the transmitter as original as possible when it ceased operations in the early 1990's.

The thermostat was mounted to the outside of the PA assembly against one of the side covers. Fleece covers were used to cover the top cabinet vents, so when the transmitter is offline the vents are covered to reduce heat loss out the cabinet itself (it has plenty enough openings already without the vents being left open!).

Testing was done both on the bench and inside the transmitter day.

During bench testing, the plate would warm to a nice 130-135 deg F and pull a steady 500 ma. @ 120 VAC. Field testing with the plate assembly mounted inside H-Set # 355, measuring ambient temperature after four hours the probe inside the PA Assembly read 77 deg F (25 C) but this was in May 2012.

Early bench testing of resistors   Installation in #298 took place September 15, 2012 during a very difficult time for me, as my father had come down with terminal cancer and passed a month later.

Further temperature measurements were taken during November 2012: inside PA assembly 67 F (19.4 C), inside main cabinet 61 F (16 C) ambient. On a very cold day in February 2013 (we'd had a long cold spell all throughout January into February), I measured transmitter gallery ambient at 51 F (10.5 C), inside main cabinet 52 F (11.1 C), inside PA unit 57 F (13.8 C) ambient with the metal anywhere from 52-89 F depending on where you took the reading with the Raytek Raynger ST2 "gun". Dew point was at 51 F (10.5 C). The heater was doing its job!

Since there is no power on to the transmitter "after hours", external 115VAC power was brought in initially with an extension cord, due to time constraints, with a later project to upgrade and install a direct line up through the floor in conduit to the transmitter. That project is currently underway. In fact, the H-set heater design has proved so successful, that MRHS has decided to direct wire all the RCA "L" and "K" set transmitters in the gallery and install Dale resistor heaters. At some future time, we may run heaters into some of the unrestored RCA H-sets.

Heaters mounted to bottom of PA assembly   In addition to the PA Assembly Dale power resistor heaters, two 60 watt infrared reptile heaters (they emit no visible light) were installed to add supplemental constant heat inside the open cavern of the transmitter cabinet. A temporary neon lamp is employed to indicate when the PA heater is on or off as governed by the SENASYS thermostat control. Longer-term, a front panel neon indicator light will be utilized to indicate external 115VAC power is on into the cabinet, in addition to the one employed for the PA assembly heater. John Felton helped design and install a similar power resistor heater solution, to keep the downstairs PA plate transformer warm and dry. Unwanted moisture and salts are considered evil things for HV plate transformers.

The PA assembly heater has been in use since September 2012 with no major issues. BL298H stays toasty warm and dry inside even on the coldest, dampest days at BL. It is a treat to open the cabinet door when I am out there and feel the warmth inside, and know that this transmitter might just be operable 500 years from now.

Dave,

I wonder, was the problem a small tantalum capacitor?

13206. E.M. Sargent 8-34 receiver Wanted to Trade ONLY

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-06-18 09:41:15 UTC
From: Joe Cro
Topic: 13206 Message: 13206

Hello All,
I have a "second" E.M. Sargent 8-34 receiver in very good condition that is secondary to my needs. I have a original 8-34 and preselector setup which I currently use. The "second" would be for trade purposes only, and not for sale.

I would like to trade it for another receiver of it's vintage and type such as a RME 9D, EM Sargent 11, EM Sargent 12, or perhaps a nice Patterson, what have you, "Rayco" or whatever from the 1930's.

I could also possibly trade for a factory produced transmitter of the era.

The E.M. Sargent 8-34 I have for swap is a very clean unmolested, unrestored variant and has all if not most of it's original componentry. I very carefully brought it up on a variac over a period of a few days and it didn't smoke or emit anything from it, including any audio. I just gave it a cursory try and didn't go into it any deeper at this time.

If you have anything like I mentioned above for horsetrading that I currently don't have and are interested in the Sargent 8-34 I have I'd like to hear from you.

I can take some pics to send to you if interested.

Very best regards,
Joe Cro N3IBX

Steve -

1) It is Dale, not Dave.

2) One of the problems in the second MT-1446 was a bad tantalum, but that set had multiple problems.

13213. Breting 14AX sensitivity problem:

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-06-19 19:58:12 UTC
From: Joe Cro
Topic: 13213 Message: 13213

Hello,
Has anyone out there found a sensitivity issue with a Breting 14AX? I have one that is as "deef as a doornail" so to speak. This receiver has a 432KC IF and most signal generators won't go down to that frequency, but I do hear products of audio down on that frequency that are being produced about 10kc or so higher.

Other than the usual maladys, does anyone know of anything peculiar to this set that may be causing sensitivity issues? As always, any information will be greatly appreciated!

Very best regards,
Joe Cro N3IBX

13216. AWA Awards - A Word to the Wise

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-06-23 21:18:24 UTC
From: Ludwell Sibley
Topic: 13216 Message: 13216

This Spring's issue of the "Journal" doesn't say so, but if you want to nominate someone for an AWA award, the deadline is close - I understand it's early July, for nominations as passed through the administrators to Headquarters. Last year, the "Journal" straggled in here, under Poverty Rate mailing, on July 27, far too late to have any useful effect. This year, with the Conference being advanced to early August, the problem will be worse.

"The deal" is that members are invited to nominate winners for six awards (Houck Documentation, Houck Preservation, Tyne Tube, Bruce Kelley - OTB, Moore, and Taylor Television). There are another seven awards which the Museum staff gives to the Museum staff, for which member input is not solicited.

For the three oldest and most important awards (the Houck ones and the Tyne), the unwritten / unpublished practice is that they are each once-per-lifetime. That is, that if someone gets the Houck Preservation award, that's "it" forever. By contrast, the BK-OTB award is fast-and-loose - two writers have each gotten it twice, and two others have gotten it three times each!

The nomination process, with one exception, relies on Snail Mail. Addresses are given in last Summer's "Journal." Apart from that, the administrator of the Taylor Award has apparently changed, per the Spring 2014 "Journal."

The awards program is handled at Headquarters with enough negligence that nominations are not a onezies-twozies matter - they are a zerozies-onezies process. So if you nominate someone, your chances of success are pretty good. (Except for that lifetime deal on the Big Three awards - if trying to nominate a previous winner, fuggedaboudit.)

Anyway, don't wait for the traditional words to drift in next August: "It is time to nominate candidates for six prizes to be given at the AWA 2014 Convention." Do it now!

Thanks for the reminder!

There is nothing at all on the AWA website about the awards. You'd think there would be a description, history, list of winners, and details of the nomination process.

And the only information I could find anywhere at all was a list of the 2013 awards in the Autumn Journal as part of the conference report, with this note:

"Nominations for the first six awards are solicited from the AWA membership at large and each winner is selected by a committee charged with administering that particular honor."

But nothing on the nomination process, deadlines, or anything else.

Using the Web site for this information is a natural and obvious course. It would help the dismal participation rate.

The "Journal" for many years ran a yearly cumulative list of winners. That stopped 20-plus years ago, but there was a one-shot revival in the May 2000 issue. You'd think it would be important to preserve the memory of the founders (think Howard Schrader, Thorn Mayes, Lloyd Espenschied . . . the list goes on) who put AWA on the map.

It would also make eminent sense to allow and encourage nominations via email, in today's world.

"Due dates" placed on the Web would obviously be on notice year-round.

There could be a bit of clarification of the rules. The Houck Preservation, foe example, is for someone "who, through personal accomplishment, has acquired and preserved by documenting an outstanding collection . . ." I remember Bob Morris, the administrator at the time, long ago trying to figure out what that meant.

None the above is exactly profound - try "plain as the nose on your face" - but none of it is being done.

Meanwhile, let's get those nominations in!

Ludwell Sibley

I purchased a SW3 last Saturday. I am just wondering what the best impedance match for the output of the '76. I am currently running 500 ohms, but I am thinking 3k-5k would be more appropriate.

Suggestions?

Chris KQ6UP

It drives my 500ohm/8ohm transformer & speaker very loudly. I do understand that it was intended for headphones, but if it is loud, what the hey. 2k might still not be optimal for the '76. Don't triodes want to see something a little higher for most efficient power transfer?

Thanks,
Chris

Subject: [AWA] My New SW3 [1 Attachment]

I purchased a SW3 last Saturday. I am just wondering what the best impedance match for the output of the '76. I am currently running 500 ohms, but I am thinking 3k-5k would be more appropriate.

Suggestions?

Chris KQ6UP

No wives tale. There is B+ on the headphones, so we're talking 175 to 225 volts… I have one set of headphones, Baldies I think, that have exposed screw terminals for the connections. I never used them with the SW-3. My favorite set is a pair of Trimm Featherweights that a friend sent me a long time ago.

Anything presenting a load between 2K - 10K ohms will work fine. It's
tetrodes and pentodes that really want to work into higher impedances.
10's of K for power tubes, 100's of K - megohms for small-signal tubes.

If it works and you're happy, use it, as long as it's safe.

My first SW-3 purchased in the early ‘90s. Bruce Kelly said that it would be a great place to start and he was right because the collection has grown quite a bit since then.

When I looked at the schematic I was in awe for two reasons: (1) I had never used a regen and thought that such a simple circuit must be a cheap “toy.” As a kid in the ‘60s and ‘70s, big, heavy superhets were all I knew. And (2), that B+ would *really* wrapped around my head? The phones are connected in series between B+ and the plate of the audio output tube. I’ll never forget the first time the set was ready for listening with a pair of ACME brand headphones. I think my hands were shaking when I reached for the phones whose cabling was now 70 years old and put them on my head.

With current products liability laws, imagine a design today where a manufacturer instructs you to do the same. Definitely use a transformer when operating an SW-3 today.

Chris, suggest you not run volume full blast as that is still too low an impedance and MAY stress the tube (you might check the ac current in the primary to be sure) if it exceeds the plate current ratings. Meanwhiloe search for a higher input Z xfrmr on net, Antique radio supply(?), etc. I have seen old tube output xfrms at ham fests too, with 2 to 5 K ohm inputs for a few bucks (bring VOM to check them and earphones). I have a late model SW3 with the fancier drum/rear projection dial seen on the SW4 (I think) and it outperformed an FT101 in sensitivity (after two handed fine tuning!). It is a great little radio. Enjoy. 73 Karl WA2KBZ

Actually, there was a lot of 1930's radio engineering put into that radio. It was a great advance over the early to mid-20's types. The shielding, Q, etc. were carefully worked out. I have a pamphlet (somewhere, after 11 moves) that described the development by the ch engineers at National. I believe it was also in QST in early 1930's issue. I used to use mine on the air in QSO's on cw and folks were amazed when I told them. Especially fun with a two tube late 1940 Novice rig on Straight Key Night. It is even better on batteries than with my small AC supply. I still use the orig tubes and fear it being dumped when I go the "other side" by XYL A good thing for all of us to consider is arranging in your will for an assistant executor to aid wife in selling/donating your radio "treasures" (often called junk by the little woman!

Nice clean mint sw3! Just think how many years of fun that set has given generations of hams.

Incidentally, my comment on arranging for proper disposition of your radios upon your permanent QRT is brought to mind by thinking of a dear friend who had barrels full of rare early thru late 1940's tubes. He was Lee De Forest's last lab assistant, a Fellow of the IRE/IEEE and a great gentleman who worked with me at Motorola for years. He was also an early TV pioneer and Mot's go to guy for CCTV systems. When you needed a tube for an early set, especially old 2 number types, Ed usually had a dozen or more and gave me several for my regens. When he died after retiring to California, I fear his antiques got dumped. Here in Mid-MO, our radio club tries hard to help out widows dispose of eradio items by selling them within club when possible and then taking them to ham fests and this helps with funeral expense as well as helping clean up radio items, while saving them for future hobbiests. Just a hint for us all to think about this. I can't tell you how
many times I have seen good radios tossed out worth hundreds of bucks because wife had no idea of worth or how to dispose/sell. 73 Karl

Here is a nice page I made several years ago. I took the SW-3 apart for these pictures. I've been meaning to update the site. Since then I acquired the rarest of the rare SW3s, the Model III with octal sockets, headphone jack and B+ switch on the front.

DOes anyone have a suggestion for a decent low cost web create software?

The price was right too. $200 for the SW3 with that power supply. The only downer was that it only came with the #64 GC coil set, and I had to drive 2 and 1/2 hours to get it. I ordered some forms so that I can wind a 63 and 63A. I have an HT-9 I am going to pick up at my grandfather's house (yes he is still living). I purchased it off of a guy on the Hallicrafters list, and his friend drove it to Arkansas. That one is in rough shape, and I will have to wait until I finish my masters' degree before I have time to mess with it.

Hi, Scott!

I'm no expert, and you may mean something else by "web create software,"
but OpenOffice (similar to MS Office, some may say better, and free)
lets you save documents as HTML. Pretty easy to create a web page with it.

Ron,

I bought a box of tubes while in Wellsboro PA. One the tubes in the box is a 3NP4 Philips Holland display tube. Do you know what years it was made?

I see you have one in Ron Lawrence's "Radio Heaven" tube show case.

Thanks Tom, N4TL

Some years ago a friend gave me a Hallicrafters R-649A, ser# is 18. It was made for the US Coast Guard. It's AC/DC and quite sturdy (about 90 lb) I was able to get it working and aligned with a reprint of the tech manual, but I would like to know a little more about it. Anyone familiar with it?

It also has double tuning between the Rf amp and mixer, 3 stages of IF, 2 rectifiers, two heater strings each with a ballast tube, and about 30 alignment adjustments. It's built like a Sherman tank. The only info on the internet is that it's rare. I already deduced that since most people don't concede that it even exists. Chuck Dachis shows one in his Hallicrafters book, and offered to buy mine if I decided to get rid of it. I have spare ballast tubes for it, but I think I would rather replace them with cap droppers or power resistors. I just checked and I have 2 manuals for it. It might pay to read them and see what they say about this mysterious radio

Leonard,

If possible do a high quality scan of one of the manuals and post it on a couple of groups for research buy those interested *especially* since information is so rare.

If you can't scan it I will bet there is someone in the local network that can do it for you.

Of the 2 manuals I have, the higher quality one is from W7FG Vintage Manuals, at: http://www.w7fg.com. The catalog lists the R-649/649A under "Military" for $36. It's well done and is complete with foldout schematics. One of the guys on the internet says he uploaded a copy to BAMA but I couldn't find it listed there. I don't have a means to scan it myself and I rarely go into town anymore. If someon really needs a manual, I could part with my other copy.

Before I can exhibit radios using the Ray-O-Vac # 9303 45 Volt 'B' battery with this artwork, I need it's little brother the #5151 22 1/2 Volt battery with taps for use as a 'C' bias battery THAT MATCHES THIS ARTWORK SCHEME.

You can view the 'B' battery artwork at the following URL: Battery-Art-13
http://kd4hsh.homestead.com/Battery-Art-13.html

http://kd4hsh.homestead.com/Battery-Art-13.html

Battery-Art-13 http://kd4hsh.homestead.com/Battery-Art-13.html Ray-O-Vac Number 9303 - 45 Volt 'B' Battery graphic for making your own reproduction.

View on kd4hsh.homestead.com http://kd4hsh.homestead.com/Battery-Art-13.html
Preview by Yahoo

I have the next version 'clouds' that is copyright 1929.

Photos, scans, borrow (with quick return promised) so I can scan, whatever.... I really want to complete this project...

Your help would be very much appreciated.

Thanks,
Robert

13260. Grebe CR-18 coils - need 16 AWG wire

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-07-02 01:28:30 UTC
From: kd4hsh@...
Topic: 13260 Message: 13260
Attachments: 1 described; binary payloads are missing from this source WARC

I'm trying to make accurate replicas of the Grebe CR-18 antenna coil.
I need 16 AWG cotton covered (natural white) magnet wire. (Maybe 18 AWG if all else fails.)

This afternoon I was able to verify the fabrication technique using some 22 AWG wire. I'm positive the technique will make a faithful replica.

I only need 30' to make several coils... Can you help?

Robert

It Is TELSTAR DAY!!!!!
July 10, 1962. This date marks the launch of Telstar 1, the first communications satellite capable of relaying television signals from Europe to North America!
Yes on this VERY day long ago our childhood TELSTAR I was launched.... and so was my fascination with Sat Com-
For those of you Non-space science folk this is sure to be a memory though ... and a great song by Joe Meek of UK but a hit indeed for the VENTURES (60s music buddies can add to this)
John R. Pierce of Bell Labs fame was the father of TELSTAR, and later in my life to become a great friend and of mine and a friend to the SMECC museum project. In addition A.C. Dickieson, the project manager for TELSTAR, ended up retiring in Sun City here and I got to know him as well. Add to that James Early who did device development for the Telstar Project another great mind and a great friend...Unfortunately all have passed on many years ago.....add to that Eugene O'Neill and other... and look below in comments and you will see some other articles about TELSTAR by some people I was happy to call my friends... I miss them all but thankful to have had the time I did with them. ok lets listen to the TELSTAR song by the Ventures....

Enjoy the walk down memory lane.... Ed Sharpe archivist for SMECC

Scratch the request below, folks. Looks like the actual number is 612.
which would make sense because I think it can run from 6V or 12V DC. The
tag on the back sure looked like "6T2" to my old eyes. I think I can
find it now!

Hi Robert
I think your Grebe style coil stock looks great.
What is the coil form material?
I made a special 40m coil from a liter soda bottle for my Grebe CR-18;
Attached are a few photos of the coil in use.

As usual, a beautiful job Bob. I see that you deviated from the original CR-18 design, as you made your feedback coil coupling be the adjustable one, instead of the antenna coil. 73 – Mike

Mike,

That is Ed's work not mine... I have yet to find the required 16 AWG wire to make accurate replicas.

Ed,

The clear film is cellulose acetate. Turns out that you can get 0.005" sheets at art supply stores.

I have made the required collapsible mandrel for 3" coils. It is wrapped with a thin sheet of Mylar film (for its no stick property) Then a wrap of the acetate. The wire is space wound tightly on the mandrel. I find it easy to use mono-filament line to space the windings. Once the wire is anchored, the mono-filament is unwrapped. (Easy)

Then all that is necessary is to take a camel hair brush and saturate the winding with acetone to partially melt the cotton into the acetate. Works like a charm.

If you can supply the wire, I will make up a length of coil stock for you. The mandrel is about 5" long. That would take about 60' of wire. If you have more wire, I would like to make a few coils for friends.

Robert

Have not been having any success in finding out the MONTH in 1927 when Philips first announced the availability of it's first screen grid RF tetrode the A442.

M-O-V claims to be the first-to-market screen grid RF tetrode with their S625. Don't know the year and month for its introduction but do know that there was a Marconi radio with this valve shown at the 1927 Radiolympia which was in late August or early September. Beating out RCA's official announcement of their type UY-222 in October 1927.

I need to know where the Philips intro fits into this time line.

Thanks,
Robert

For sale a Bound set of Radio News, once owned by RCA Labs. Vol 1 & 2 are rebound, the rest are bound original, with covers, and in good shape for their age.

I paid $1300 for the Radio News about 8-10 years ago. A professor down in NC owned them prior to me. I would like $1000 for them now.

From the beginning Vol 1 #1 1919 through June 1921, then a few missing through 1922, then continuously to 1948 #12.

Delivery to the AWA meet in Rochester August 14 -or- pick up in Southern NJ.

13297. For Sale: 1938 National HRO

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-08-11 00:56:50 UTC
From: steve@...
Topic: 13297 Message: 13297

1938 National HRO S/N Y53. I am the secomd owner. Includes matching coils and coil box, power supply, speaker, original manual with original sales receipt. Also the original wooden shipping crate, I doubt there are many of those around.

The original owner replaced the pin plug and jack with 1/4 inch jack for the speaker. It could be changed back to original without much work. The manual is not in great shape, the covers are quite dry.

The receiver was last used by me in 1994 for the AWA contests. I have not powered it up since then. It is a bit dusty but otherwise in very good condition.
It would be very difficult to find a set in this condition and known history. I am asking $800 for this receiver. If I can provide more information, please ask. Contact me off-list.

I will not ship this set so it must be picked up, or possibly I can meet or make a delivery within some reasonable distance.
I will not be able to be at the AWA Conference but live near the AWA Museum.

Photos are at http://rx320.doesntexist.org/hro/index.html

Thank you for looking.,

Good heavens. Too many people and not enough old radios. Hope it doesn’t get too crowded to get to the Charlotte meet! I knew NC was popular but not that Popular.

Joe

The Southeast U.S. region used in this study. (Terando et. al/PLOS One)

By Darryl Fears <http://www.washingtonpost.com/people/darryl-fears> August 9

Giant urban sprawl could pave over thousands of acres of forest and agriculture, connecting Raleigh to Atlanta by 2060, if growth continues at its current pace, according to a newly released research paper from the U.S. Geological Survey.

“We could be looking at a seamless corridor of urban development,” said Adam Terando, a research ecologist with the USGS and an adjunct professor at North Carolina State University who was the study’s lead author.

The development will engulf land from North Carolina to Georgia, and possibly spread to Birmingham, Ala., “if we continue to develop urban areas in the Southeast the way we have for the past 60 years,” he said.

Combining USGS demographic modeling with North Carolina State’s High Performance Computing Services and analyzing the data for six years, Terando and his five co-authors estimated that urbanization in the Southeast will increase by up to 190 percent.

It will nearly mirror the decades-old development of the Northeast corridor, from Washington to Boston, Terando said, and in Florida from Jacksonville to Miami. “I would say that’s definitely a future that the study is pointing toward,” he said.

Land cover change metrics shows projected urbanization for 200 model simulations for the study region and twelve ecoregions. Abbreviations are as follows: BR – Blue Ridge, CA – Central Appalachians, IP – Interior Plateau, MACP – Mid Atlantic Coastal Plain, MAP – Mississippi Alluvial Plain, MVLP – Miss. Valley Loess Plains, P – Piedmont, RV – Ridge and Valley, SP – Southeastern Plains, SCP – Southern Coastal Plains, SFC – South Florida Coastal Plain, SA – Southwest Appalachian. (Terando et. al/PLOS One)

Development on that scale would result in losses of 15 percent of agricultural land, 12 percent of grasslands and 10 percent of forests, the study said. It would take the form of tract housing developments, business centers and thousands of miles of paved roads.

The research paper was published last month <http://www.plosone.org/article/info%3Adoi%2F10.1371%2Fjournal.pone.0102261> in the journal PLOS One. Its co-authors include Jaime Collazo and Alexa McKerrow, also researchers at USGS, and Curtis Belyea and Rob Dunn, researchers at North Carolina State.

“The upshot is that . . . climate change isn’t the only story in the Southeast,” Terando said. “There are large-scale human impacts on our environment . . . the way we develop.”

Numerous species of animals would be left with no habitat. The loss of woodlands that soak up rainfall would leave local waters more vulnerable to the storm-water runoff that washes nutrient pollution from lawns and motor oils from roads, in addition to increased garbage.

Carbon from automobile traffic down a more crowded Interstate 85 corridor would add to the ills contributing to climate change.

“The drawbacks are obviously things like more traffic,” Terando said. In Raleigh, there are a thousand miles of streets, and 2 percent to 3 percent must be repaved each year, according to the USGS, meaning more tax dollars will be needed to repair more roads.

A megalopolis is pretty much what it sounds like — a giant city or sprawl that spreads over a region. It is described as an urban complex comprising many major cities. Between Raleigh and Atlanta along the study corridor are Greensboro and Charlotte, N.C., and Greenville, S.C. Nearby are Columbia, S.C., and Birmingham.

Land cover change in patch metrics between 2009 and 2060. (Terando et. al/PLOS One)

Over the past 60 years, the Southeast has grown 40 percent larger than the rest of the United States, the study said, with 77 million people living in a region where development has been suburban and highly dependent on cars.

The biggest change will likely happen in what the study called the Piedmont eco-region between Atlanta and Charlotte, cutting through South Carolina. The largest proportion of change, where land will be noticeably transformed, is expected to be in the Southwestern Appalachian region.

But models are rigid and do not account for uncertainty or change. They cannot predict how local leaders will plan to develop land or whether they will use more ecologically friendly methods of development.

“Unless we change course . . . urbanization will have a more pronounced ecological impact in many non-coastal areas of the Southeast than climate change,” said Jennifer Costanza, a research associate at North Carolina State and another study co-author. “It’s impossible to predict the specific ecological outcomes . . . but so far, the projections are not good in terms of biodiversity and ecosystem health,” Costanza said.

13299. AWA Awards - 2014

Can someone report on last night's recipients of the Big Three awards ("Houck Documentation," "Houck Preservation," "Tyne Tube")? A flash report would be welcome.

Thanks,

Ludwell Sibley

Hi Lud,

Joe Knight presented the Tyne to the Japanese fellow who set up a big collection there. I forget his name.

I don't recall hearing anything on the "Houck Documentation," or "Houck Preservation,".

The great thing about the Dinner was, there was "No dinner speaker". This improved the event and it moved along with the various award presentations and we all got to see the contest entries, or the auction entries for a much longer time. This was well received.

Me: I won two blue, one for my Hallicrafters S-1 (against another S-1 repainted, and an S-2 repainted. Mine was original as found. the other was for my Massie coherer. BTW I took it to pre 1912 show and tell and it was the star there too. And I won a red ribbon for new construction, my Station Pro 2 I built for my Collins desk. I had a large photo of my station, 18 x 24, with red LEDs showing the project working, and left it turned on for all to play with it. I didn't win with my 4th entry, the Panic/115v ac power supply (Open class) as there were too many really nice other entries.

Robert Lozier won several awards for his outstanding restoration work. Perfection!

The contest room was overflowing with outstanding displays, really nice. Geoff Borne mentioned that perhaps next year they will enlarge the room again. It really was overflowing.

The BC-610 of Roy's and other Hallicrafters ham equipment was working and on the air in the hall, next to the contest room door and was a major attraction for us hams.

I'm still receiving 'miss your column' thank yous from so many there. Makes me feel good.

My 'Voices from the past' was well received and I have two requests to take it to ham clubs later on. Hopefully I will be able to travel. Getting older.

I attended several other presentations, all of which were outstanding.

The Member forum went well starting with a presentation of the the work getting the new BIG VOA Collins transmitter to the museum. The Q&A and suggestions part to improve the meet went well with several 'very good' suggestions.

The fleamarket look larger than 2012 with fair weather. (didn't go last year) I noticed much of what was offered was of high quality. Certainly one could have added to their collections. I resisted the urge and didn't buy anything.

The bookfair was full to overflowing with all the usual suspects there. Prices I noticed were very fair.

I had to rush home on Saturday morning to attend a family reunion, so I missed the Auction and did not look over the items in the pre-view.

Not again !!!!I made the mistake of writing a LONG response and finding that the top half of the response just disappeared..... I just cannot get used to remembering that the only SAFE way to deal with Yahoo is to write the response in a text editor and then paste into this #$%&@ window.So for now, here is the last part of my response that did not get eaten...Maybe more later...>>>>>>>>>>>>>The local worker bees were stretched thin meeting the demand to have the museum open Tuesday, Wednesday & Wednesday evening and (I think.) even some time on Thursday & Friday..To help with registration, the conference had some paid workers. I think they encountered some of the same problems we have seen at the Antique Radio Charlotte meet hiring folks for a couple of days that are not familiar with the nuts and bolts of our type of event. For me, little things that are a real annoyance such as; a name tag where your name appears in 10 or 12 point type and no city & state info. A schedule that got reprinted a number of times on Tuesday & Wednesday... There were STRONG opposing opinions on the wisdom of salvaging a 250 KW Collins TX and TX control room from the VOA Delano decommissioning. It was an amazing effort on the part of volunteers to make it happen. It remains to be seen how this acquisition can be effectively incorporated into a museum already bursting with other interesting and significant hardware and stories to tell. The Phase Two build-out of the museum that incorporates the VOA TX and many more shelves of exhibits in time for next years conference seems to be a 'scarey hard' challenge to pull off. The Old Equipment Contest continues to bring in some amazing exhibits with a wonderful spread of interests.... In a back corner, the Barts brought in an outstanding collection of communications theme vintage posters from WW-I and WW-2. The Best of Show went to Steve Wallace for a 1913 F.B.Chambers time receiver with Audion bulb AND a half dozen detailed 1913 letters specific to this set.As usual, there were a couple of categories where there were a large number of entries. Any one of which would have been a strong contender for a blue ribbon at any other contest. For example, a large display of Brightson Blue tubes in their presentation boxes only mustered a third place in brutal competition.My two exhibits of British and Italian sets kept me busy fielding questions and getting compliments for the types of restoration/conservation and documentation that I do.The auction on Saturday morning was very disappointing. Roy W. was told that there would be a group of special items in the sale and published that in the program. However that did not happen. One mistake I think they made was in not having a $25 minimum bid. The paper and tube auction had Rich Estes getting 'beat up' MANY times trying to get $2 just to avoid a no sale. I wound up bidding $15 for one paper item and realizing that there was nothing else I'd want to take home. Barney Wooters usually handles auction check-out but he was quite frail and had to go to an ER to be treated for dehydration and checks. Bottom line, It was 2 1/2 hours into the auction before check-out could begin. I could say that after 41 visits to this conference I’m going to quit…. But the fact remains that it is the ONLY CONFERENCE offering four days + activities worth traveling hundreds of miles to get to… Robert

Robert –

Thanks for the report. Yes, the set Steve has is indeed a beautiful set. I used to have one, BTW the only other one known, and I sold it to Howard Stone. You can see it on his web page. I have known of this other for a long long time and it became available recently. While I was interested, I already have way too much, and Steve was already talking to the owner about it, so, when the owner approached me I refused him and allowed Steve to get it. Of course Steve is tickled pink and is happy for the award also. It is nice to see some of this relatively younger blood be so enthusiastic. Thanks again for your report. 73 – Mike

Attachments: 1 described; binary payloads are missing from this source WARC

Attached is a cut from a 1927 Burgess Battery catalog hosted on the American Radio History site. What I need are any images showing the THREE cell version of this battery. It appears that they did not advertise these batteries in radio magazines even when RCA was specifying them for the Radiola II circa '23/24.Even a crude line art picture might give me enough info to recreate the Three cell art making the assumption that the two cell has the same theme.... The only questions would be the horizontal placement.

Thanks,
Robert

Wikipedia says burgess came under Mallory Battery which came under Duracell. Did you think of contacting them on the off chance they might have some old drawings or pictures or art work?

Just a thought. Worked for me with a cigarette pack!

Joe

Subject: [AWA] Burgess 4.5 volt advertising pictures. [1 Attachment]

Attached is a cut from a 1927 Burgess Battery catalog hosted on the American Radio History site. What I need are any images showing the THREE cell version of this battery. It appears that they did not advertise these batteries in radio magazines even when RCA was specifying them for the Radiola II circa '23/24.Even a crude line art picture might give me enough info to recreate the Three cell art making the assumption that the two cell has the same theme.... The only questions would be the horizontal placement.

Thanks,
Robert

Had not noted that, THANKS. A couple of years ago I tracked down the corporate records of Eveready. They are at the Rutherford B. Hayes Presidential Library in Fremont, Ohio.... An on-line look at their holdings don't look promising when it comes to the 1920s but if I could drive that far, I'd like to go thru the 20 something record boxes.I'll see if I can find a contact.

Robert

Robert,

Not what you want, but have a Burgess C battery type 2370. Rectangular, four posts on top stamped +, -1 1/2, -3, -4 1/2. It has the vertical black and white stripes with the Burgess shield front and back and text on the end panels. Description of use on one end and patent information on the other.

73,
Barry

Hi Barry,The rectangular batteries used as 'C' bias in 20s radios seem to survive pretty well in collections.... I do have one or two Burgess of that style. What seems to be 'unobtanium' is 'A' batteries other than the #6 dry cell variety.

Because these seem to be so rare, if one does pop up the owner is not going to want me peeling off the label just to put it on a flat bed scanner. By the end of the week I expect to have up and running a round battery scanner ! I already know the concept because I designed the mechanicals for a wine bottle label scanner a few years back.

If you have not done so yet, please take time to read my intro web pages on documenting battery artwork.

Just yesterday I completed my round battery scanner. I've built a web page for it.

http://kd4hsh.homestead.com/Rnd-Bat-Scan-00.html
http://kd4hsh.homestead.com/Rnd-Bat-Scan-00.html

So if you have any rare batteries you want scanned, I can do it for you at very low risk to your artifact. It will only cost you the shipping both ways. You will get non-exclusive raw scans that you can use for any reason. If I choose to make corrected images, I will make them available to you.

Please keep in mind that I am especially looking for the 4.5 Volt round batteries used in the RCA Radiola II. The RCA Red Book recommends Eveready 'Tungsten' #705 or Burgess # 232.

I'm still meditating over the hue of the orange/red and how 'dirty' to make the white.

I've made 6 of the housings.

Am keeping my fingers crossed that I can come up with the Eveready Tungsten #705 and Burgess #232 artwork.

I saw that, Alan. Actually, it was Pg 35. I've seen little solid state disks that you could slip over the pins of a defunct tube to simulate its function, but that was some time ago. I experimented myself, doing the same thing, but inside the base of the tube. I used a MPSA42 transistor and a 2N3819 FET, with a "grain of wheat" lamp to simulate a glowing filament. The process of geting the base off the tube was the hardest part. Of course, it wouldn't work on mini glass tubes. Anyhow, I abandoned the project when people started giving me tubes, and I no longer needed to simulate them. Also. I found that a lot of tubes could be restored by just resoldering the pins.

Leonard

Leonard, maybe i'm missing something, but those 1L6 subs, they are in glass envelopes, aren't they?
And if so - how did they get them open?
Many ages ago, around the time of the fall of the Assyrian Empire, i made a tube base substitute for
the 6BA6 in my Lafayette KT-200 receiver so it could use the 9-pin 6EH7 framegrid pentode. I cut the "base" off a 6BA6. It was not the neatest job in the world, but it did work great.

When I experimented with FET replacements for tubes in my R-392, I cut 'em open with a high speed Dremel cutoff wheel. At high speeds it actually melts through the glass!

Afgter modifying the tube, I installed a slip of paper, and then glued the tube shut. Hee hee.

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-09-10 02:49:19 UTC
From: Ludwell Sibley
Topic: 13341 Message: 13346

On the 1L6 replacement: I hope the vendor knows what he's talking about re capacitance(s) on the substitute. That was the big problem in trying to use a 1R5 in a Trans-Oceanic: a different grid is used for the RF input, so the 1R5 worked fine in the BC band, but, going up in frequency, it became harder and harder to get the alignment right (couldn't get the top band right at all). I hope he's talking about dynamic (Miller-effect) capacitances. I found out the alignment problem while doing a "production run" of three restorals.

On the 50A1 substitute: This is like sending in a squad of Marines to do a boy's job. The 50A1 can be replaced with a 1-K 3-watt dropping resistor and a 9-volt Zener on the filament bus.

As for replacing the other tubes in the radio: well, the original types are still in good supply (nothing rare like the 1L6).

Anyway, the Trans-Oceanic is a sort of cult icon, but, in modern terms, it's not that great a radio.

Ludwell Sibley

Thanks for the EXCELLENT idea!
Certainly better than my effort, which had some rough edges!

Now re the R-392, which tubes did you replace?
I have always liked the idea of tubesters!
Especially for foreign equipment, where you might be asked to pay $35+ for a tube equivalent to the
6SK7, about a $2 tube (new) at hamfests.

The slip of paper you installed in your tubesters, what was on the paper?
Your own "tube number"?
A sketch or photo of tube innards?
Or a small photo of a lighted cityscape at night?

A diamond cutting wheel in a Dremel would do it best, as it would be least likely to overheat the glass.
I would use a drop of grease or oil on the cutting wheel also.

A diamond cutting wheel in a Dremel would do it best, as it would be least likely to overheat the glass.
I would use a drop of grease or oil on the cutting wheel also.

It appears the tube is cut in half and gutted. The solid stste components are installed and the tube resealed or glued back together.

Leonard, maybe i'm missing something, but those 1L6 subs, they are in glass envelopes, aren't they?
And if so - how did they get them open?
Many ages ago, around the time of the fall of the Assyrian Empire, i made a tube base substitute for
the 6BA6 in my Lafayette KT-200 receiver so it could use the 9-pin 6EH7 framegrid pentode. I cut the "base" off a 6BA6. It was not the neatest job in the world, but it did work great.

Have been looking high and low for the red wax used in the tops of dry batteries of the 1920s.

There is sealing wax for letters and documents... WAY too expensive and does not look quite right.

Machinable waxes but almost always in green or blue. Amber and white are available but priced really high because they are used in denture fabrication. (greedy &%$#). Don't know how easy/hard it would be to add a colorant like a mahogany wood dye.

Not being an artist, I only stumbled across sculptors waxes yesterday. Anyone ever thought of using them for battery replicas?

Robert

Au contraire!

You want to heat the glass, so it melts at the cutting edge. The higher speed on my Dremel does just that , with a standard thin cutting wheel. As you apply the tool, the glass turns red hot at the edge of the tool, and you can cut the tube open quite easily!

The paper I insert has my callsign (natch) and other info for future reference.

13359. Estate sale in Raleigh, NC

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-09-14 15:22:04 UTC
From: Tom Lewis
Topic: 13359 Message: 13359

Today there is an estate sale in north Raleigh. 50% off marked prices today.

I just came from it and there are six at water Kent radios in metal boxes. There are two Freed Eichmann radios. I saw one telegraph key, sounder and repeater on a nice wood base. Also miscellaneous radios and parts. If you go don't forget to look up at the shelves in the garage. There is a nicely built homemade linear amplifier that looks like VHF or UHF, can't tell by just looking at it but its too small for HF.

Antiques, Radios & Ham, Furnishings, Dollhouse Making, Silver, Pistols.... Starts On 9/13/2014

Beyond Miller capacitance and cold electrode capacitances, it is likely that the 1L6 differs from the 1R5 in the level of "induction effect", as translated from the German [Induktionseffekt], and described in US literature as a result of transit time effects in a retarding field. This effect is caused by an outer grid forcing electrons back upon an inner grid thus causing a conduction on the inner grid that increases with frequency. The effect has a negative capacitance characteristic and is sometimes compensated with an internal or external capacitance on the order of 1pF between the two grids. This effect is particularly troublesome at short wave frequencies where the small 455kHz IF separation between RF and LO frequencies makes matters even worse to make the LO frequency dependent on the RF tank resonance. At 30MHz, the LO is only 455kHz away.

I gleaned this info from the Philips series of tube text books circa 1940 and also from the German language "Roheren-Handbuch" by Ludwig Ratheiser in 1952. E. O. Herold's IEEE mixer papers of the 1930's-40's also mention the effect often.

Is there some kind of paper describing the fundamental operation of the 1L6 in the context of contemporary multigrid mixers and converters?

-Joe

It's a great site with an amazing amount of content! But I'm having a problem with the search on certain magazines, and the site owner doesn't see any errors when he tries it, although he did say there had been extensive site changes last week.

I'd appreciate it if someone would go to this page for Popular Electronics, click on the "Search Popular Electronics" button, and search for any term. Then on the results page, click on any result and see if it loads a PDF of that page, or returns an error.

I am using a Google Chromebook.I just did a search on the site for term= SB-310 and it pulled up several results.
I knew that there would be targets for this search because just last night iwas reading a review of the Heathkit SB-310 in P.E.-Hue Miller

No problem downloading full issues, but when doing a search you should
be able to download a PDF of a single page of any of the results. That's
what is broken.

When i first visited this site, some months back, i was thinking i should offer him some of my paper, to fill out some missing in his catalog. Or to offer some more obscure stuff. I REALLY enjoy looking thru the old articles and ads, and it seems many others do also. There's nothingquite as comfortable as paper - but - it weighs like crazy, when you have years of it, and inmany mags, you can see the paper already disintegrating. The other night i was looking at a copy of Zig Zag magazine, kind of a Chilean LIFE magazine, from 1940, and while i wasenjoying it, i was also thinking, this magazine won't take a whole lot more of page turning.Speaking of LIFE magazine, when will "someone" do that, i wonder!!!-Hue Miller

No, I believe because LIFE is still in copyright, Google's agreement with the publisher prohibits downloading of full issues. Generally, this can be done only with material dated 1922 or earlier.

Somewhere between 1952 and 1956 I built a littie one tube AC regen out of Radio Electronics, (or maybe Radio News) using a 9001. I've downloaded all the RE's (and RN's) from 1946 to 1956 but I can't find the article. 4 issues are missing, and it would be my luck that the radio is in one of them. I still have a couple of parts and a complete set of coils from the one I built waiting to be reactivated. As I remember, it used a small 6V xfmr for the 9001 heater, selenium rectifier for B+, there was a tapped loading coil, and there was a small knife switch on the front panel for STBY. It's a departure from my usual Rube Goldberg projectss, but nostalgia does funny things.

13385. RE: [AWA] Solid State Replacement for 1L6, 1R5, etc

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-09-17 19:45:54 UTC
From: Ludwell Sibley
Topic: 13341 Message: 13385

The "pentagrid" coverage in the 4th edition of the "Radiotron Designer's Handbook" mentions effects of internal coupling in the two types of converters and compares "inner-grid" vs. 'outer-grid" signal injection.

Sylvania may have put out something in their Engineering Bulletin series on introducing the 1L6 in 1949, but that's a r-e-a-l-l-y obscure source. The EIA registration filing on the 1L6 gives only tabular data, with no further discussion. RCA had put out an application note on the 6SA7, but that was 10+ years earlier.

Ludwell Sibley

To: antiquewirelessassociation@yahoogroups.com
Subject: RE: [AWA] Solid State Replacement for 1L6, 1R5, etc

Beyond Miller capacitance and cold electrode capacitances, it is likely that the 1L6 differs from the 1R5 in the level of "induction effect", as translated from the German [Induktionseffekt], and described in US literature as a result of transit time effects in a retarding field. This effect is caused by an outer grid forcing electrons back upon an inner grid thus causing a conduction on the inner grid that increases with frequency. The effect has a negative capacitance characteristic and is sometimes compensated with an internal or external capacitance on the order of 1pF between the two grids. This effect is particularly troublesome at short wave frequencies where the small 455kHz IF separation between RF and LO frequencies makes matters even worse to make the LO frequency dependent on the RF tank resonance. At 30MHz, the LO is only 455kHz away.

I gleaned this info from the Philips series of tube text books circa 1940 and also from the German langu age "Roheren-Handbuch" by Ludwig Ratheiser in 1952. E. O. Herold's IEEE mixer papers of the 1930's-40's also mention the effect often.

Is there some kind of paper describing the fundamental operation of the 1L6 in the context of contemporary multigrid mixers and converters?

-Joe

Still looking for the red or brown potting compound used in the tops of batteries in the 1920s. TOUGH TASK!

Well my $44 investment in three 'flavors' of sculptors wax yielded no joy. Shrinks as bad as straight paraffin.

Deeper searching seems to suggest a variation of traditional sealing wax (for documents) formulations. Ratios of one part dry shellac flakes to four parts bees wax or paraffin plus a colorant of your choice. The colorant in the case of Eveready batteries maybe being iron oxide and some other mineral filler to bulk-up the the material and make shrinkage less of a problem.

Dry shellac flakes are EXPENSIVE... The local Woodcraft store wants $39 for a 1/2 pound... On-line, (Shellac.net) 1 lb. of their cheapest stuff can be had for $30 with shipping. (I'm going to buy that...)

Artist grade dry colorants are far too expensive for this kind of potting compound. There appear to be dry colorants for concrete by Davis Colors and others. A local distributor says he will sell me a small quantity. Hope to go there tomorrow.

I already know that I can use urethane plastic resins but getting the color and luster just right is still a problem. At this point I'm just not happy with results that an 'educated eyeball' can spot as not quite right.

Still any comments welcome....
Robert

WANTED - 20 AWG stranded - RUBBER covered wire.

In lengths as short as 4". For project total I need no more than about 20 ft. Must be still very flexible and have insulation thickness typical to what you find in old radios. (i.e. Not thick high voltage rated.)

Black is the preferred color.

Robert

Ratios of one part dry shellac flakes to four parts bees wax or paraffin plus a colorant of your choice. The colorant in the case of Eveready batteries maybe being iron oxide and some other mineral filler to bulk-up the the material and make shrinkage less of a problem.

Dry shellac flakes are EXPENSIVE... The local Woodcraft store wants $39 for a 1/2 pound... On-line, (Shellac.net) 1 lb. of their cheapest stuff can be had for $30 with shipping. (I'm going to buy that...)

Artist grade dry colorants are far too expensive for this kind of potting compound. There appear to be dry colorants for concrete by Davis Colors and others. A local distributor says he will sell me a small quantity. Hope to go there tomorrow.

I already know that I can use urethane plastic resins but getting the color and luster just right is still a problem. At this point I'm just not happy with results that an 'educated eyeball' can spot as not quite right.

Still any comments welcome....
Robert

Forwarded from the Society of Broadcast Engineers - Portland list.

This thing, about as "modern" as tube transmitters come, uses 4-400s IIRC. Under U. S. rules, at least, you can "own" 160 meters with it.

Not my deal!

Subject: [SBE-PDX] Free Bauer 707 Available

James Boyd K7MKN, of Boyd Broadcast Services, needs to get an early 70s Bauer 707 1 kW AM transmitter out of his garage in Tualatin, OR. Free to a good home.

This transmitter was the main, and then the backup at 1450 KBPS here in Portland until it was replaced by their 2nd solid state rig a few years ago.

Could be put back on the AM band or used as a ham transmitter. Pictures at http://www.oldradio.com/archives/hardware/707.htm

My wife and I helped move it. The heavy transformers were removed and are separate to make it easy to move in a U-Haul trailer, etc.

E-mail me krandles@entercom.com or James boyd.broadcast@....

Thanks!

I've used fiberglass resin, the material just does not have the same look as the sealing compound. It looks as 'plastic' as the urethane resin.

The toilet ring wax is specifically made to NOT get hard over time. You can always very easily mark this wax with your fingernail and it still feels sticky. The battery sealing compounds of the 20s are pretty scratch resistant and not sticky. Exactly like the sealing waxes used on documents.

I'm Speaking at NEAR-Fest XVI, the big
BoatAnchor Hamfest in New Hampshire
Friday, October 10, 2014 @ 12:00 Noon

I will be speaking at NEAR-Fest on Friday at 12-noon. My presentation is really "BIG" and I am happy to present this for you. I think this is a first for Ham Radio.

Topic: Old Transmissions and Voices from the Past .

You will hear early Ship-Shore and Ship-Ship 500kc CW Transmissions, and see and hear the voices of the early Ham and Radio Pioneers. You'll hear them tell their own stories; Hear the voices of Marconi, Jack Binns, Irving Vermila, De Forest, Gernsback, Armstrong, Reinartz, Deloy - French 8ab, Elmo Pickerill, Art Collins, General Griswold, and CD Tuska speaking about starting QST magazine.

You will also hear an actual SOS received by David Ring, N1EA, who was the operator on the Super Tanker "WILLIAMSBURGH" who answered the SOS from the passenger ship "PRINSENDAM" in 1980.

Notice: No recording of presentation, copyright.

Posted on the Ham Radio History Forum:
"Congratulations to John Dilks, K2TQN, whose outstanding forum "Old Transmissions and Voices from the Past" was a true highlight of the ARRL National Centennial Convention in Hartford this past week. " NEIL D FRIEDMAN N3DF

From: Ludwell Sibley
Topic: 13401 Message: 13401

This, from the Seattle Society of Broadcast Engineers list. Interesting opportunity to (maybe) do some DXing on HD radio. Dunno how badly the co-channel junk will mess this up, but let's see. Of course, your finest analog radio is helpless here.

Ludwell Sibley

Fox Sports 1380 (KRKO) and Classic Country 1520 (KKXA) originate North American all-digital AM radio tests October 2nd through October 7th. Stations will suspend analog transmissions for experimental broadcasts in partnership with NAB Labs.

Everett, Washington - If you're hearing silence on your radio this weekend, it may be time to purchase a new receiver. The Federal Communications Commission has approved experimental test authority for Everett area radio stations KRKO-AM and KKXA-AM to serve as the final all-digital test stations out of nine chosen by NAB Labs, a division of the National Association of Broadcasters. The testing will require both radio stations to broadcast their programming utilizing all-digital HD RadioT Technology and temporarily suspend their analog broadcasts for periods of time between October 2 and October 6, 2014. NAB Labs is collecting test data to better understand the performance characteristics of all digital transmissions via AM radio. Results of the tests will be processed and submitted to the Federal Communications Commission in 2015.

According to the Seattle Area Radio Association and Ibiquity Digital Corporation, there are approximately 223,907 HD Radio-equipped vehicles in Seattle and 50& of the new vehicles sold Y-T-D in the Seattle DMA shipped with HD Radio Technology. Nationwide, over 20 million receivers are equipped with the new technology. Nearly 40% of new cars delivered in 2014 are equipped with HD Radio receivers.

"Listeners in King County with analog radios can receive approximately 26 FM signals, but those who have radios with HD RadioT Technology can receive an additional 33 channels, many of them commercial free," said Chuck Maylin, executive director of the Seattle Area Radio Association. "Many people don't realize that HD RadioT Technology gives them free access to programming and radio channels they can't currently receive on analog radios."

Listeners with analog radios will hear silence when tuned to 1380 AM and 1520 AM during test times. Listeners with radios that have HD RadioT Technology will hear audio quality similar to that of FM Radio except with no static, and listeners tuned to Classic Country 1520, in particular, will hear stereo separation along with the full audio range of the country music being played. The coverage area of both radio stations should also increase

during the tests.

"These all-digital tests are an important step in the evolution of an industry that produces great content at no charge to the consumer," said Andy Skotdal, general manager of Fox Sports 1380 and Classic Country 1520. "People who want to listen to streaming audio on their cell phones know it kills their cell phone battery and can have a costly impact on their data plan. This technology will give us the ability to deliver all of our content with superior sound quality on our biggest distribution channel: the over-the-air transmitter."

Fox Sports 1380 and Classic Country 1520 are encouraging listeners from Tacoma to Bellingham to tune in to 1380 AM Saturday from 9:30 AM to 4:30 PM and to 1520 AM Sunday from 9:30 AM to 4:30 PM. Listeners with radios capable of receiving HD RadioT transmissions will be invited to participate.

###

KRKO 1380 AM (Fox Sports) all-digital test times (subject to change until October 2):
Saturday, October 4, 9:30 AM - 4:30 PM
Sunday, October 5, 9 PM - 1 AM
Monday, October 6, 9 PM- 1 AM

KKXA 1520 AM (Classic Country) all-digital test times (subject to change until October 2):
Thursday, October 2, 9 PM to 1 AM
Saturday, October 4, 9 PM to 1 AM
Sunday, October 5, 9:30 AM to 4:30 PM

13402. Index to the Receiving Tube Manuals

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-10-06 00:45:56 UTC
From: Dale H. Cook
Topic: 13402 Message: 13402

For many years I have been collecting receiving tube manuals from a number of tube manufacturers. I have prepared an index to simplify finding data for any given type of tube. The first edition includes all of the receiving tube manuals in my collection published through 1945, from Cunningham, GE, RCA, and Sylvania. It is in PDF format and can be read online or downloaded from:

<http://plymouthcolony.net/starcity/radios/pages/service.html#tubedata>http://plymouthcolony.net/starcity/radios/pages/service.html#tubedata

After that was posted I discovered some tube manuals online published through 1945 that I did not have, from Arcturus, National Union, and Raytheon. I am currently adding those to create a second state of the first edition. After that is posted I will begin work on a second edition which will include all manuals that I have access to up through 1949. Note that this index is for receiving tubes, and I do not include manuals of transmitting and instrument tubes or of CRTs (unless included in a receiving tube manual). HB-3 is not included because it covers a wide range of tubes and is indexed online.

I always welcome sets of scans or PDFs of manuals that I do not have, or links to those manuals online, so that those manuals can be added to this project. Note that I already have all of the RCA receiving tube manuals and probably know of all of the most familiar sites holding manuals such as tubebooks.org.

I'm selling my Classic Microphones collection at NEAR-Fest.

I'll be inside The commercial building with a lot of my personal collection.

My prize Spark transmitter.

I also have a Navy WW-2 clock, Johnson Navigator, National SW-3 and coils, some keys, etc.

I'm also speaking at 12-Noon, Voices and signals from the past.

Come see me.

13405. Photos of WWII Home Record Recorder and Ham Radio Recruitment on the Air

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-10-09 14:47:47 UTC
From: Charles Bliley
Topic: 13405 Message: 13405

Greetings fellow AWA members:

1940s HOME RECORDING RECORDER

I am working on expanding my digital collection of home record recordings my father made in the 1940s of family history and radio broadcasts. Now, I want to illustrate one of my Web pages with a photo(s) of the recording unit he used, but alas, I have none. He was a technophile who loved ham radio and everything related to electronic communications. No doubt, this was a fairly rare and very expensive home entertainment product at the time.

Does anyone have any photos--advertising or personal--of this home recording system, I believe manufactured by RCA, that could play and record professional-grade vinyl, and disposable vinyl and paper records, has an AM-FM radio, and is encased in a wood floor cabinet with two lids on the top. (Seen in back right-hand corner of family photo.) The left-hand lid exposed the record player/recorder and the right-hand the radio and amplifier controls. It was approximately, four feet wide, two-feet deep and about 40 inches high. Of course, it has a nice walnut veneer. ;-)

And yes, I played with making recordings when I first got into ham radio back in the 1960s. I even made recordings of some of my two-meter QSOs. I will save those exciting recordings for a future announcement. ;-)

RECRUITING HAMS FOR WORLD WAR TWO SERVICE

Few if any of his recordings would be of interest to this group, but one may have some passing interest the radio hams. I made a quick and dirty transfer of an off-the-air recording made in January 1942 of various senior people interested in increasing the number of radio hams serving in the U.S. armed forces. The beginning is a bit quiet for a few seconds, but the remainder is of good quality. The last speaker is the ARRL president, George W. Bailey, W2KH. Perhaps, they were saving the best to last (last 25%). After all, us hams would most likely find a fellow ham more persuasive than a general any day. ;-)

The posting is a temporary one until I edit it and adjust the pitch to make the people sound a bit more human and manly. I offer it as a preview only. Please do not link to this URL.

Thanks for the help. :-)

RCA News, Volume 2

EINSTEIN VISITS HIGH POWER RADIO
Reported by Pierre H. Boucheron

Professor ALBERT EINSTEIN, the German scientist was given a practical demonstration of high speed transoceanic wireless communication recently which greatly interested him. The demonstration was staged at the great radio station of the Radio Corporation of America at New Brunswick, N. J., under the direct supervision of leading radio and electrical engineers of America. Messages were passing through the station at the rate of 50 words per minute from Broad street office in New York City direct to Europe, the signals being shown on oscilographs.

During the visit, messages were exchanged with different stations in Europe and at the conclusion of the test, Professor Einstein expressed his pleasure and interest at the high perfection of American radio development, and his astonishment at the big scale on which Americans handle such problems as wireless telegraphy.

The day's outing took place on April 23rd and was arranged for the noted scientist by officers of the Radio Corporation. Leading American Telephone and Telegraph Co., the Western Electric Co., and the Radio Corporation were present. These noted personages are shown in the photograph which was taken in front of the New Brunswick Radio Station and are identified as follows:

Reading from left to right are: Mr. James Casey, special representative of the New York Harold; Messrs. W. A. Graham, W. A. Winterbottom, David Sarnoff, Thos. J. Hayden of the Radio Corporation; Dr. E. J. Berg, Mr. S. Benedict of the General Electric Co., Professor Albert Einstein, Mr. John Carson of the American Telephone and Telegraph Co.; Dr. C. P. Steinmetz of the General Electric Co.; Dr. A. N. Goldsmith of the Radio Corporation; Mr. A. Malsin, Dr. Irving Langmuir, Dr. Albert W. Hull of the General Electric Co.; Mr. E. B. Pillsbury of the Radio Corporation; Dr. Saul Dushman of the General Electric Co.; Mr. R. H. Ranger of Radio Corporation; Dr. G. H. Campbell of the American Telephone and Telegraph Co.; Mr. C. H. Taylor of the Radio Corporation; Dr. W. Wilson of the Western Electric Co.

Early in the morning Professor Einstein went to the Central Telegraph office at 64 Broad Street, New Your City. There he was met by Dr. C. P Steinmetz, Dr. A. N. Goldsmith, Dr. Irving Langmuir, Dr. Albert W. Hull, David Sarnoff, C. H. Taylor and others. At this office Professor Einstein was shown the method of remote control whereby the operators there, control the powerful transmitting apparatus of the New Jersey Station. While he was inspecting the station, communication was established with the radio station at Nauen, near Berlin. In order to demonstrate the efficiency of the radio communication. Professor Einstein sent a message of greeting to the officer in charge of the German station.

[<http://en.wikipedia.org/wiki/David_Sarnoff#mediaviewer/File:Albert_Einstein_with_other_engineers_and_scientists_at_Marconi_RCA_radio_station_1921.jpg>
Exactly six minutes later he received the following reply "Many thinks and reciprocations. Most hearty greetings to the great German Scientist" Officer in Charge at POZ Shortly after this another message was sent to Count Von Arco, one of the leading German radio scientists. This message was signed by Einstein, Langmuir, Stein, and Goldsmith." In 1919, this old New Brunswick, New Jersey Marconi Company wireless station on Easton Avenue in the Somerset section of Franklin Township, Somerset County, New Jersey became part of the newly organized Radio Corporation of America (RCA) as station WII under the World Wide Wireless logo. See the Marconi Station in New Jersey article for more info. Note: This picture has the popular culture attribution of being a depiction of Nikola Tesla standing in the second row between Einstein and Steinmetz. Tesla historian Marc Seifer identified the man as AT&T engineer John Renshaw Carson.[7] RCA News, Volume 2 By Radio Corporation of America (1921)[8], Capital District Library Council Digital Collections and RCA Engineer, Volume 17, RCA Research and Engineering, 1971 page 4 also identify the man between Einstein and Steinmetz as "John Carson".]

Apparently Mr C. H. Taylor was Assistant Chief Engineer under E. F. W. Alexanderson. Sarnoff was only General Manager at the time, and in 1930 Sarnoff became president of RCA.

By the way the crippled hunchback in venter was almost rejected on Ellis Island because of his weak and deformed body. Sadly. But that body contained a mind of great power. Dr Steinmetz along with Nikola Tesla were the fathers of our electric power industry more than Edison who was stuck on DC. Btw a good friend ,elmer on video and railroad radio systems design and a Fellow of the RCA (Radio Club of America) was Lee DeForest's last lab assistant. Ed Dervisian was also a ham, AWA and ARCI member and fellow with me in the Society of Wireless Pioneers. He and a great radio systems engineer got me into antique and regen radios. So i am only 2 "radio generations" from DeForest and Tesla. In other words i am getting REALLY old! 73 Karl WA2KBZ Sent on a Sprint Samsung Galaxy S® III

Most quality radios are $20-$25

http://tinyurl.com/NY-Radio-Estate-Sale

Estate Sale

Starting Wednesday, October 15th, there will be a Huge sale [two floors] of over 250 vintage radios including: Battery sets... Superhets... Crystal sets... Home brews... Farm sets... Vintage Amateur station... Modern amateur station ... keys... Communication receivers... Transmitters... Parts... Tubes... Books... Horns... Speakers... Test equipment...
.... Everything priced for quick sale!

Most quality radios are $20-$25...house is sold and must be vacated.
The sale is by Appointment, day or evening:
Call the daughter - Ursula @ 203-524-4939

Note: I visited the sale early, I was invited by the daughter.
All the radios I saw were in excellent 'as-found' condition,
dust free and stored inside on shelves.

The property has limited parking and 'NO' on road parking.
You must call for an appointment.

The home is located near the NY - NJ border,
just off the Garden State Parkway.

~ Not all radios are shown ~

Boy John,

That looks like paradise for 20s home brews. Would really have enjoyed 'lifting the lid' on those sets.... Except for the superhets, there is probably not that much value for the family. I hope they do well.

From: Dale H. Cook
Topic: 13420 Message: 13420

Perhaps the third most-used receiving tube manual (after the RCA and Sylvania manuals) is "GE Tubes: Essential Characteristics." I have two editions - ETR-15E and ETR-15G. Have any of you been able to determine the publication dates for any of the Essential Characteristics manuals? If not I will just assign approximate dates to them based upon the most recent tube types that each contains.

Scott Frankland, in his "Vacuum Tube Electronics: Reviews of the Major Texts" (1998), assigned 1964 to Essential Characteristics, and I have sent him an email asking the basis of that attribution.

I have two of them.

One has the Ninth edition inside on the first page and its dated 1962 at the bottom of that page. It has ETR-15J on the back page.

The other one has ETR-15H on the back cover. It does not have the edition number or date like the other one.

Subject: [AWA] GE Essential Characteristics Dates

Perhaps the third most-used receiving tube manual (after the RCA and Sylvania manuals) is "GE Tubes: Essential Characteristics." I have two editions - ETR-15E and ETR-15G. Have any of you been able to determine the publication dates for any of the Essential Characteristics manuals? If not I will just assign approximate dates to them based upon the most recent tube types that each contains.

Scott Frankland, in his "Vacuum Tube Electronics: Reviews of the Major Texts" (1998), assigned 1964 to Essential Characteristics, and I have sent him an email asking the basis of that attribution.

>One has the Ninth edition inside on the first page and its dated 1962 at the bottom of that page. It has ETR-15J on the back page.

That confirms the year, which I had seen suggested online.

>The other one has ETR-15H on the back cover. It does not have the edition number or date like the other one.

That is likely 1959.

>I just found the number on mine. It's ETRM-15N. The cover is a little chewed by silver fish so I almost missed it.

I'll bet it has "GE Tubes and Transistors" in the upper left of the cover and "Essential Characteristics" as the main title like ETRM-15P.

No, it doesn't have that on the cover, but it does have pictures of transistors on the cover.

Leonard

13429. A Beginners Guide to Long-Distance AM Radio Listening

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-10-20 16:21:04 UTC
From: ygroups@...
Topic: 13429 Message: 13429

Gang,

I just discovered a document I put together last DX season. The nights are getting longer, so I've posted it to the Radio Technology Museum site;
http://www.rtm.ar88.net/Radio%20Listening.html
http://www.rtm.ar88.net/Radio%20Listening.html

Download it, print it out, and warm up your radio. You'll have to make minor allowances if you're out side the NYC area.

Above all, have fun,

Al Klase - N3FRQ

13430. Re: Photos of WWII Home Record Recorder and Ham Radio Recruitment on the Air

Greetings All:

Several of you replied to my request for information on the console radio/recorder set my father used during World War II. I followed the leads that were provided, but without any concrete results.

I think the respondents were a little confused. The device was a radio and record player/RECORDER for home use. The only sets I could find from the leads were phonograph players and not recorders. Heaven only knows, it could have been a prototype that my father was "evaluating" for the manufacturer. With lots of connections in the radio and electronic industry, this is a likely case and the presence of a name brand on the unit, while related, does not mean it was a commercialized product.

The image pursuit is not vital as I am blessed with over 20 recordings of family activities and history. The recorder photo would be a nice complement to my Web page of the recordings, but hardly essential.

Somewhere in my non-digital photo archives is one that shows the console more clearly. When I find that photo, I will post it on the Web for you to see. Until then, I will continue to look on the Web.

Thank you for your help. :-)

Wilcox-Gay made several different models of a Record/Play machine with a built in radio. not sure of the models but it was in the mid 50s and possibly earlier. I think they were called Recordios.

!WOW! !BINGO! !RIGHT ON!

Thank you John for your information. I had forgotten the Wilcox-Gay brand and when I did a search for it on Google images, I saw a familiar photo of the exact model that I am trying to research. It was a photo from an eBay sale that was still active. I went to eBay and checked it out. Sure enough, it was the EXACT model. (http://www.ebay.com/itm/Wilcox-Gay-Recordio-Antique-/271637185215? Ends: October 22, 6PM EDST)

After looking over the photos online and considering the seller's location just 80 miles west of my home town of Erie, and seeing the very familiar microphone included, I am certain this is the unit that I my father purchased and used in the 1940s. I also used as a teenager in the 1960s, and then gave away! I wish it was in pristine condition, but never mind, I know it survived--albeit with some wear and missing knobs--for almost 75 years!

No, I am not interested in purchasing it; I do not have room for it, and if I did, my wife would never allow it in our house. I am at a period in my life when it is time to "lighten the load".

However, I would like to know the model number and possibly get a advertising photo or illustration to put on my Web page of my dad’s recordings. I made this request of the seller.

Thank you all on the list for feeding me ideas. I never thought it would lead to this outcome!

73,

A very happy Chuck :-)

Hi Chuck,

Glad I was able to shed some light on your search. I would have snagged the eBay photo and put it on this site buy wasn't sure of the legality so I left it up to the individuals to search it out as you did.

I used to hang around a radio store in Asheville, NC back in the early 50s and that is where I first saw and played with the Wilcox Gay units. The store had several different models, some with radios and some without. They also had a large console unit with the record/play deck built into a sliding drawer behind a door. The other door, as I recall, covered the radio and speaker. I still remember the smell of those discs and actually have one around here somewhere that was recorded at a school fair featuring a quick interview between my sister and myself. If I ever find it and it will still play, I wan to dub it to a CD..

Cheers,
John, W4AWM

13435. Atwater Kent Receiver and Speaker

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-10-23 03:10:50 UTC
From: Gary H. Harmon, Jr.
Topic: 13435 Message: 13435

Recently I picked up a clean model 33 with the matching E3 speaker.

The 33 is very clean but the PS was not available.

The E3 looks good but needs the front and rear cloth replaced. I removed the front cover and speaker looks to be recently replaced. I removed the two nuts on the rear thinking the mechanism and speaker would fall out but no luck. Is there something I need to know to remove the innards in order to replace the lining?

Also, what PS or PSs should I be looking for to complete the set?

Thanks.

Folks,

I need to measure the BURGESS logo that is molded into the wax tops of early Burgess 'B' batteries.
I do NOT need the logo that says: BURGESS "B" - I already have that.

Bring it to Jamestown if you can,,,,

Any other scarce batteries would be great to photograph while we are there... Bring them too...

Thanks,
Robert

13440. Sort of common knob wanted

Howdy All-

It's the usual-- I've got a small radio knob hoard and in it I found ONE needed knob. I need at minimum one more. I'd break into song if I could find three exactly the same.

I know that PTOP/Gary Schneider could be a likely source.

I'm looking for a somewhat common knob: It's an "Arrow" knob with a 1-1/2" bottom skirt. It's got a hemispherical crown with an arrow molded into it; sloping serrated sides and a skirt around the base. See pix.

As usual I've eight small such knobs in the hoard but only one 1-1/2" base knob-- I would love one more. If you've got three that are absolutely identical-- YEAH!

Anyone have something like this in your junk box say for a couple of bucks a knob? See the pix.

Many thanks in advance for you time and your help.

Regards,

Rob aka "Vollumscope"

Here's a neat ~17 minute podcast on Radio Row in NYC, but you need to
suffer through the first few minutes of intro/commercial. There is also
a 1929 video (with audio) of Radio Row on the page that is 2-3 minutes long.

http://www.radiodiaries.org/new-podcast-radio-row/

Someone had posted this on the Glowbugs reflector.

Topic: 13447 Message: 13447

I have posted a revised Index to the Tube Manuals:

http://plymouthcolony.net/starcity/radios/pages/service.html

This revision incorporates addition tube manuals published through 1945, and has about 1/3 more entries than the original version posted in October.

It will be a while before I start compiling the second edition, which will include manuals through, perhaps, 1950. It is much easier for me to work from scans of the manuals and I do not yet have all of the manual scans through 1950 ready to go.

Treat yourself to Rod Burman displaying some of his vast tube/valve collection in his magnificent estate:

<http://www.aparchive.com/metadata/-TT-UK-Valves/1c7d366f78f2b36cb124a98b694560f2#>
Isle of Wight - recent

1. Wide of Woodvale House exterior

2. Wide of interior hall with guest arriving, dogs in hall

3. Mid of billiard room, with Rod Burman walking in followed by two guests

4. UPSOUND: (English) Rod Burman, valve collector

"Here's a chance to see some of the valve collection. It's about 5% of my actual collection here."

5. Tilt down to display cabinet filled with valves

6. Close of Rod Burman taking Fleming diode out of box

7. UPSOUND: (English) Rod Burman, valve collector

"This is a Fleming diode from 1889, if it's original."

8. Close of diode, tilt down

9. Wide of Rod Burman and two guests leaning over billiard table examining diode

10. Close of spark transmitter

11. Mid of Rod Burman and guests playing with spark transmitter

12. Close of diode lighting up

13. Mid of diode with guest examining it closely

14. SOUNDBITE: (English) Rod Burman, valve collector

"And he called it a valve because it would only allow current to pass in one direction. And that's where the name valve came from and why in the UK we call them valves, and the Americans call them tubes, which is short for vacuum tubes."

15. Wide of Rod Burman and guests reflected in mirror

16. Close of glass valve and reflection of Rod Burman moving towards it

16. Close of illuminated German Loewe valve, world's first integrated circuit

17. SOUNDBITE: (English) Rod Burman, valve collector

"The reason it was done like that was that in Germany at this time, and that was 1927, there was a tax on radios depending on the number of valve holders in the set. So this only needed one valve holder, so you paid less tax."

18. Wide of hall as Rod leads them upstairs.

19. Tracking shot through shelves and stacks of valves

20. Close of guest looking at filing system

21. SOUNDBITE: (English) John Haunsfield, retired airline pilot

"I think this is absolutely incredible. You've got to have a very special brain to be involved in all this. I understand that he has over a quarter of a million valves here, and that is not really including his private collection of antique and really, really, historically interesting valves."

22. SOUNDBITE: (English) Christine Burman, Rod's wife

"As I've said before they're not very pretty, and I do wish he'd collect something, I don't know, pretty, interesting, but there you are. I've got dogs and he's got valves."

23. Wide of hall filled with valves

24. Close of coloured Geisler Tube and crackling noise

25. UPSOUND: (English) Rod Burman, valve collector - (sound overlaid)

"These things are called Geisler tubes. They were invented long before valves, when they first discovered an electric current would go through a tube containing gas. It ionises the gas, and the ions are what give you the effect."

26. Various close of large valve

27. SOUNDBITE: (English) Rod Burman, valve collector - (sound partly overlaid)

"Well it's a mobile phone package that's got access to the internet via the mobile phone network, and it all started with a few sparks and a coherer. Over a hundred years ago. And there it is. And that's a hundred years of progress."

28. SOUNDBITE: (English) Christine Burman, wife of Rod Burman

"I think sometimes we'd never have had the house. He only bought it to house the valves."

29. Close of Rod Burman's face illuminated by glowing valve

LEAD IN

Today we take things like the Internet, mobile phones, digital television and satellites very much for granted.

They're powered by microprocessors, and these tiny electronic chips are at the heart of every aspect of our daily lives.

But where and how did it all begin?

Tucked away in a castle on the Isle of Wight, off the South Coast of England, retired electronics entrepreneur Rod Burman has built up a unique private collection charting the very beginnings of the electronic age.

StorylineGo to top
Some people collect stamps, or vintage wine.

Whereas Rod Burman has a passion for valves, of all shapes and sizes.

Inside his quiet home, Burman's collection charts the history of electronics.

Showing a group of guests around his collection, he says only about 5 per cent of the valves he owns are on show.

The collection comprises of nearly one million valves.

One of his prised valves is a Fleming diode, from 1889.

The idea of putting a metal plate inside a vacuum with a filament, was devised by the American scientist Thomas Edison in 1887, while he was trying to improve his recently invented light bulb.

But it was the British scientist Sir John Ambrose Fleming who was to discover it's full potential.

He met Edison in 1888, and took some of his new diodes back to England.

In 1901, Marconi proved that radio waves could cross the Atlantic.

But detecting the signals was a problem, they were too weak.

It was another 3 years before Fleming realised the diode could detect the radio signals.

Burman says the name valve comes from the fact that the electric current can pass only in one direction.

The world's first valve still works today. The filament's resistance to electric current causes it to heat up.

It emits electrons, which are the electric current, and they're captured by the plate.

Flemings discovery launched the radio age.

By the 1920's valve radios had already started to appear.

But it was a German company called Loewe who invented the world's first integrated circuit.

Burman says at the time in Germany there was a tax on radios that had more than one valve.

Today his collection has spread to an entire wing of his castle, entirely devoted to the valve collection.

These are just a few of the many rooms full of valves.

John Haunsfield, a visiting guest, says anyone collecting so many valves must have a unique mind.

Yet not everyone shares Burman's passion for valves.

His wife Christine says she wishes he collected something different.

As the tour approaches its end, Burman has another historic invention to show his guests.

Called Geisler tubes, Burman says they were invented long before valves.

An electric current travels through the tube containing gas. It ionises the gas, and the ions are what give the brightly coloured effect.

This is how neon signs began.

Holding a mobile phone, Burman says it all started over a hundred years ago, thanks to valves.

Christine Burman says sometimes she thinks her husband bought the property just to store his valves.

Despite what his wife may think, Burman seems more than happy to be left alone with his valves.

From: digital-conjurers@...
Topic: 13449 Message: 13449

For the Hams here:

Anyone know why these seem to be always in such demand? Was it:

1) A design flaw (under-rated), or
2) The predilection of some Ham AM enthusiasts to "open up the bottom audio end" of the 'Scratchy Apache', possibly leading to increased demand on the thing, and blowing it out prematurely thereby?

..or maybe the old "gotta turn it all on without going through it first" syndrome...?

I've heard two completely opposite opinions based on two Hams' experience so far....But they _do_ seem to be asked for a lot...and I had to run down one for my TX-1 when I first got it....took forever.

Just curious.

Look here for all mil designations. This is a collins microwave horn feed but not sure what type use. If aimed down from plane likely terrain radar or if used with dish on ship is radar but a possibility is close in ship ship commo. I know of no such so imo radar. See below. 73 Karl http://www.designation-systems.net/usmilav/jetds/an-ara2arc.html Sent on a Sprint Samsung Galaxy S® III

Does anyone in the group know anything about this antenna? I assume microwave or something very high frequency. I've searched google and bing and found nothing on it. The name plate says it's a "AS-3084/ARC-172". There are a couple photos below. Thanks a bunch.

Further it looks like a horn feed to gun laying -pointing- radars. A tight beam for commo useless on a ship without a gyro platform to keep it steady. Search radars are usually shaped differently. This seems to be a narrow pencil .beam type used with data from a search radar to lock on a gun. Karl Sent on a Sprint Samsung Galaxy S® III

Oh if you want to use it for ham microwavrs measure wave guide or feed probe at base to give you an idea of freq range. If probe it may be a 1/4 wave and if a dipole a half. Lowest freq is somewhat above the halfwave freq of widest side. Karl Sent on a Sprint Samsung Galaxy S® III

ARC means airborne usually. GRC means ground radio. That does not mean one can not use a set in a special use. ARC-5 sets are a n example in ham use. But they were intended for aircraft. In Navy they covered 190 kc up to around 12 mc. So in retrospect this item was in a plane. Its use for commo is puzzling. I still vote for radar. But i have been wrong! Karl

Rethinking comments. Was thinking of ant appearance, not the major unit nomenclature. Definitely not radar. The APQ 172 is radar terrain avoidance i used to work with such units. Definitely ARC series is only aircraft radio comms. But odd use. Karl Sent on a Sprint Samsung Galaxy S® III

13458. Bruce Kelley 1929 QSO Party

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-11-22 02:19:23 UTC
From: Whitebear1122
Topic: 1486 Message: 13458

> Here are the rules from the 1929 QSO. This is what is published in the AWA Journal and should be up on the AWA website. I hope to work all of you 29'ers in the QSO Party. This year Bruce Kelley's call sign W2ICE will be on the air for the first time since his passing. Try to work the special event station if you can. Special W2ICE QSL cards will be sent for valid 29 contacts. Send your QSL and SASE in care of Ed Gable at W2AN AWA headquarters. 73, Scott WA9WFA
>
> The 2014 Bruce Kelley 1929 QSO Party and W2ICE Special Event Station
>
> The Bruce Kelly 1929 QSO Party is a yearly AWA sponsored event where participants build their own transmitters using the designs, techniques, and tubes that were available in 1929 and earlier, and then put those classic transmitters on the air and try to contact as many other 1929 stations as possible. Since they use early designs, it is a cacophony of whooping, chirping, buzzing, clicking, drifting, swishing, swaying, warbling, and other interesting signals. This is what ham radio sounded like in 1929 and for two weekends in December its 1929 again on the ham bands.
>
> This year for the first time we are activating Bruce Kelley’s W2ICE callsign as a 1929 SPECIAL EVENT STATION! W2ICE hasn’t been heard on the 1929 QSO Party since Bruce’s passing so this will be a real treat to hear and work the namesake station of this event! A special event QSL card will be available for valid contacts with W2ICE. QSL information will be posted on the AWA website. W2ICE is operating as a 1929 station and contacts count just like any other station. The 1929 QSO Party was started in the early 1990’s and championed for many years by Bruce Kelly W2ICE, an AWA co-founder. Prior to Bruce’s passing, he asked his close friend John Rollins W1FPZ to keep the 29 QSO Party going. John Rollins managed the QSO party for many years and renamed it the Bruce Kelly 1929 QSO Party in honor of Bruce. Ten years ago John Rollins asked me to manage the 29 QSO Party for him and Bruce, and to keep the event alive because it meant so much to both of them.
>
> Dates and Times: First two weekends of December, Saturday Dec 6 through Sunday Dec 7, and Saturday Dec 13 through Sunday Dec 14. Starts at 2300Z (6:00 PM EST) Saturday night and finishes at 2300Z (6:00 PM EST) Sunday night, both weekends.
>
> Objective: Contact as many 1929 stations as possible. Contact exchange consists of RST, Name, QTH (State such as ME or MN or NY), last two digits of the year of the transmitters design or publication (such as 29 or 27 or 23), type of transmitter (such as TNT or TGTP or MOPA or COLPITTS), and power input (such as 6W or 9W).
>
> Rules: Transmitters must be 1929 or earlier types of self oscillators such as the Hartley, TNT, PP tuned grid tuned plate, MOPA, Colpitts, etc. No crystal oscillators. Tubes must have been available during or before 1929. Typical tubes often used are type 10, 45, 27, 211, 71A. Individual stations can be worked only once on each band over the course of two weekends. You can use any vintage or modern receiver that you wish. The event is open to all 1929 stations including non-AWA members and AWA members. You are encouraged to join the AWA and support 1929 radio!

>
> Input Power: Transmitters are limited to a power INPUT of 10 watts or less. However, to help make East-West contacts, power may be increased to 20 watts INPUT between the hours of 0500Z (12 Midnight EST) and 1300Z (8 AM EST). Note this is INPUT power. Power input is calculated by multiplying PA plate voltage x total PA plate current. Example: my plate voltage is 300 volts dc, and plate current is 30 ma, so total input power is 300 x 0.030 = 9 watts input. Stations running more power than this are considered “modern” for this event and do not count.
>
> Frequencies: The QSO Party typically operates between 1800 to 1810 Kcs, 3550 to 3580 Kcs , 7100 to 7125 Kcs, plus or minus depending on QRM. 40 meter activity is up significantly because it offers both night time AND daytime propagation! So when 80 shuts down Sunday morning, I hope to see you on 40m.
>
> Logs: Please submit your log so we can see who you worked and acknowledge your effort! Either electronically email your log to Scott at HYPERLINK "mailto:wa9wfa@..." wa9wfa@... or mail via post office to: Scott Freeberg WA9WFA, 327 Wildwood Avenue, Saint Paul, MN 55110. Logs must be in the 1929 QSO Party log format otherwise it will be difficult to score you. An official 1929 log sheet will be available for download from the AWA website. Please do not email logs to any other email address except to the WA9WFA account. Because of email problems in the past, I will acknowledge receipt of all email logs. If you do not receive an acknowledgement within a couple weeks, better check with me to make sure I received it.
>
> Scoring: Remember that contacts with modern or high power stations DO NOT COUNT. Only count legitimate 1929 contacts. If you are contacted by a modern station, be polite, mention the AWA QSO Party and point them to the webpage for more information, then move on, or QSO them if you wish. We will count contacts with W2AN, the AWA club station. Scoring is simple. Add up the number of legitimate 1929 QSO’s. Example: if you make 15 QSO’s on 80 meters,10 QSO’s on 40 meters, and 5 QSO’s on 160 meters, your final score is 30. All submitted logs will be scored and the results published in the AWA Journal. Please submit logs by January 15, 2015. 73, Scott WA9WFA

13460. GUIDANCE/TIPS: Attic Long Wire Antenna - ground

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-12-01 23:40:48 UTC
From: litehousekeeper@...
Topic: 13460 Message: 13460

I am pleased to share that after many years shoehorned into a small condominium building (concrete structure w/no reception), my wife and I are in the process of building a 2 story house. I've done considerable on-line and book research regarding antennas, and frankly have found some elements (notably grounding) less clear than before.

So - I intend to install a long wire antenna the length of our attic - (interior, uninhabitable space) - optimized to minimize half-wave disturbance, I've identified 29 feet as the ideal antenna length. Feedline would be coaxial to the first floor for connection with the radio. Ground - I had originally planned would also be coaxial to the basement, where it would be connected to a lead brought through the foundation from the grounding rod. Arrestor between the antenna and feedline? Do I have this right? Any ideas/suggestions/concurrence/warnings?

I've only a week or so to finalize with the Builder the lines they will be running between the attic and 1st floor/basement. Guidance is much appreciated!

Well, my two story house is apparently wider than yours. I have installed a 44' center fed dipole, fed with 450 ohm ladder line down to the second floor bedroom which is my Radio Room. I installed the plastic conduit myself. Using the balanced antenna means I do not need a ground.

I use a Johnson Matchbox to feed the ladder line, have heavy coax about 18"long to my TS440S/AT and use both tuners to get out on bands 80, 40 and 20 with reasonable SWR.

Technically, if you install a grounding rod for your equipment it should be firmly bonded with the house service entrance ground. Not usually easy to do.

Clare

13462. RE: [AWA] GUIDANCE/TIPS: Attic Long Wire Antenna - ground

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-12-02 00:19:23 UTC
From: Joe Koester
Topic: 13460 Message: 13462

Whatever you run consider conduit. Then as things change you can always pull new wires in. Great flexibility for the uncertainties of the future.

With regard to grounding there is considerable discussion as to whether you should attach your ground to the ground the power company brings into the house. There are arguments for either side.

I ran copper under all the irrigation lines in the yard and to the well casing and to galvanized culverts in the ditch. But I haven’t hooked up to the driven rod from the power company or anywhere along their neutral/ground. I’m just not sure. So many Hams have so many different positions and opinions.

Joe

Clare, your tuner chassis should be grounded not for rf but for lightning. Also arrestor or grounded ehen off coax switch. Ground to cold water and ac gnd in cellar. A strike can come thru roof and zap uour ant. 73 Karl Sent on a Sprint Samsung Galaxy S® III

Morning Charles,
You might try Play Things of Past. He has a vast inventory of '20s and up parts.
You could also built up a prototype using whatever your junk box has and later
replace with period parts. The only period part really necessary for the BK event
is the tube which must be from 1929 or before...as well as the circuit. Are you using
the TNT from Dec '29 QST?

Lee,
If it is not too late, have your electrician wire the house with the romex wire coming up from the main panel to your outlets without crossing over the attic floor and down the walls. These wires near your antenna will detract from the performance. Install a double loop. That's a figure 8 pattern squared off and conforming to each gable. The center of the figure 8 loop tacked to main beam. Feed it with ladderline (or dual coax, [shields tied together at each end and one end attached to the tuner case ground]) from a Johnson matchbox balanced output. It will tune up on about any freq..

I have the building info from a QST from the early 30s. I wish i had a copy of the one from the 1929 QST. I did have some parts and lost most of them during a move.

Hi Steve:

Long time no talk. Go to the AWA website and look at the "events" then the "On the Air" section. The log sheets and the rules for each event are posted there.

C U on BK

Try this Charles....
http://www.arrl.org/pubindex/search/page:3/Merged.year:1929/Merged.month:12/Merged.pubs:QST/model:Merged
Look down the page for "The Single Control Transmitter".
Maybe you can down load the pdf file...its the '29 Dec TNT.
This direct link to the article, might also work: http://p1k.arrl.org/pubs_archive/11762

I used a 201A for my TNT...worked fine at abt 2w input.

Can anyone suggest where I may be able to buy some of these clips? These are slightly larger than the ones on a standard 9V battery at 0.419 inches across. In case the photo does not go through, what I am looking for is identical to the negative female contact on a 9V battery, but whit the dimensions I mentioned. Thanks for any help. 73 - Mike

Nice setup, I have a Comet Pro Crystal in the stack. I like the FB7 due to the band spread coils, only GC for my Comet. PSK preselector helps too.

Topic: 13477 Message: 13480

I'm looking forward to working everyone over the next two weekends in the Bruce Kelley 1929 QSO Party!! I'll be operating as W2ICE/0, Bruce's call that is held by the AWA. If you make a valid 1929 QSO with W2ICE, you can submit your QSL and self addressed stamped envelope SASE to Ed Gable at W2AN and you will receive an original W2ICE QSL card in return. All logs go to me though like always.

I fired up the push-pull Colpitts this week and it's working "ok". This will be the last year with that transmitter as it's time for something new. The transmitter developed a jumpiness that I haven't been able to resolve. Sometimes it'll jump a couple hundred cycles for no apparent reason. It's either a marginal connection somewhere or a cap breaking down. So I wouldn't have your cw filters set too sharp with me or I might jump out of the bandpass. hi hi

It's been fun seeing the beautiful 1929 transmitters that you guys are building!

73, Scott WA9WFA/W2ICE/0 for the weekend

13486. W2ICE/0 Comments from The Frozen Tundra

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-12-07 04:12:47 UTC
From: Whitebear1122
Topic: 13477 Message: 13486

Taking a break to stoke the wood stove which is keeping the shack nice and toasty on this chilly night.

I've been having fun working the 29 QSO Party as W2ICE/0. Just as a reminder, W2ICE was held by Bruce Kelley, one of the founders of the AWA and the 1929 QSO Party sometime around 1982. I managed to work N1BUG, VE3AWA, AA2YV, , N3GJ, from the North east , heard and called W1GIG several times, but haven't heard NE1S or other 1,2,3 landers yet. Been on 80m the whole evening but I'm just not hearing much from our New England friends. Hopefully I'll hear more in the morning on 80 or later on 40m.

Right now I'm faintly hearing VE7SL but just in the noise.

The 29 push pull Colpitts has been work pretty well. No one complains hi hi. I do have the morse code key taped to the chair arm to keeping the vibration down.

If you guys worked KC9WYV, he is a 12 year old boy working the 29 QSO Party at the QTH of Harold KB0ROB. That's why you haven't heard Harold on tonight. He's letting Joe work the event under his own call sign. That is very cool!

73, Scott WA9WFA

13488. BK From BC

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-12-07 17:25:08 UTC
From: Steve
Topic: 13477 Message: 13488

Well let's hope that condx are better next weekend as they were far from the usual early December delight, at least from this end. Conditions were poor enough that I didn't hear anyone in MN until the 5th hour! The Minnesota boys usually dominate the BK activity on this side as there are so many of them but last night it seemed that everything must have been going right over the top of their heads for several hours. Although signals were very fady and weak for the most part, propagation was long during brief lifts to the east.

All told I managed 29 contacts with some highlights being N1BUG Maine - on both bands, WA1JAS (40m - Maine and the loudest signal from back east), NE1S (40m - Maine), K4JYS (40m - NC), WB8APR (40m - MI), AA2YV 80m - NY), VE3AWA (80m - ON) and of course, the two best catches of the night...W2ICE/0 Scott running 'headquarters' duty and KC9WYV - 12 years young Joe and an absolute first-class CW op thanks to the mentoring of Rob, KB0ROB in MN.

Perhaps the 'wind god' believes he is helping to make my signals sound more '29-ish as once again, the BK Winds developed right on schedule, making all of Ross Hull's superb Hartley-genius sound poorer than even Lou would yearn for. I also noted a lot of AC-sounding notes, inluding my own...more than usual, and thought maybe a little auroral activity on some of the E-W paths may have been the cause, maybe not.

After seeing how my experimental type-10 amplifier performed when driven with the Hull Hartley during earlier tests this week, I am now very motivated to put a proper MOPA together for next yeaar...something all on one platform, as trying to mate two separate boards is an operational nightmare.

Hopefully there will be some new faces next weekend and more than ever on topband...it looks like the sun is getting very quiet once again so it should be nice. A nasty coronal hole stream blasting us last night was what put the damper on things.

Steve / 73

13489. BK From MN

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-12-07 19:21:25 UTC
From: Whitebear1122
Topic: 13477 Message: 13489

Wow I agree with Steve, conditions are horrible this weekend! Last night 80 meters was fair at best. I did work a couple west coasters, a couple east coasters, but I didn't hear the usual W1, W2, W3 crowd like in previous years. Seems like the band never went long. I did hear and call W1GIG several times with no luck. In years past I've listened as the East coasters start appearing on the horizon and then signals build and we work them for hours and hours. This year it was spotty at best. I heard N1BUG most of the later evening. I did work Steve VE7SL after 0500 when I shifted to high power, 20 watts input. Steve, I told you 10 watts but had just upped the power and was so darn used to sending "ten". hi hi I hope a lot of the guys are taking advantage of QRO after midnight Eastern time.

40 meters this afternoon is dead. I made two or three contacts and that's it. Even the main cw part of the band is quiet too. Maybe something will change the band might open up later this afternoon, otherwise we have to hope for better propagation next weekend.

If you guys hear me on 40m this afternoon, it's windy out and I've got a lot of wind modulation on the signal. Wonder what it sounds like from far away.

Agreed, the MOPA can be a nice stable transmitter since the oscillator can be driving at low power levels to maintain stability while letting the amplifier stage do it's thing without affect stability too much.

By the way, did you guys work KE0Z from South Dakota last night? First time South Dakota has been on the event. WIll had a great signal here with his Hartley.

Would love to work California some time.

13492. Re: GUIDANCE/TIPS: Attic Long Wire Antenna - ground

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-12-12 00:25:23 UTC
From: litehousekeeper@...
Topic: 13460 Message: 13492

Thank you all for your kind replies, and please forgive my belated response.

To answer some of the questions posed:

My immediate plan is for the antenna to serve as a receiver only - no transmission. I will have two radios (receivers) located on the first floor - one in the living room, and another in the (adjacent) study.

Clare/Karl - my concern regarding grounding is two-fold. First, to dissipate any built-up static, and second as a protection against lightening strike through the roof.

Ron - my objective with careful calculating the long-wire antenna length is to maintain a low standing wave ratio (swr) so that the antenna would not be a half wave which would yield high impedance on certain frequencies. I referenced the following page in identifying an ideal antenna length:

http://www.hamuniverse.com/randomwireantennalengths.html
http://www.hamuniverse.com/randomwireantennalengths.html
I'd like to be able to tune in as much of the AM and Shortwave band as possible.
Joe - excellent suggestion regarding conduit. Unfortunately, I am very limited with regard to the 'custom' requests we can make of the builder, which generally builds tract homes (ie. standard floor plans, structural design, etc). I'll see if I can convince them to do conduit as indeed it would give me great flexibility, but may be a stretch to request at this point. I'll try!

Steve - very good tip re. attic wiring. I am very much interested in your double-loop suggestion, but am not quite clear on how it would be made - re. "figure 8 pattern squared off and conforming to each gable"? Can you expand on that?

I remain concerned with how my antenna, be it long-wire or double-loop, might best be grounded to protect against static and lightening.

Lee:

There should be no static build-up as long as your antenna is either connected to the radio or a coax switch connected to your equipment. There's little exposure for an inside antenna to have static build up on it anyway.

If you have a lightning strike through the roof you have a much more serious situation. There's nothing about an antenna inside that would make it attract a strike through the roof that's different from you other house wiring and other conductors. If you have any sense that the house is vulnerable to a direct strike, you should definitely talk to someone about lightning protection for the house! (lightning rods or whatever). The more likely scenario is to have a nearby strike that will induce energy into your antenna and coax, which frankly it will do to your house wiring and other conductors.

If you do have outside antennas, then you have other considerations about inside antennas. Particularly what happens when an outside antenna gets a direct hit and your common ground for your station (hopefully a single-point ground) goes to 5 or 10 thousand volts. Any inside antenna connected to that panel will have that energy induced on it. You therefore need to approach it the same way you'd approach anything else in the house that's connected "through" your ground panel (like power, phone, network, etc) and take measures to minimize the distribution of that energy.

HI, all,

I'm looking for a Loktal (not Octal) socket that mounts with the retaining ring, as shown in the photo. Will pay a reasonable price, or will trade for another type of tube socket in my junk box. (I have micanol sockets that would fit a 1625, for example.)

I made 11 QSOs in bruce Kelley contest but in the ensuing cleanup, I have lost my log sheet.

I made 3 on first weekend and the rest on the second weekend.

alas. If i used the computer to log they would have a backup. hi hi.

Interesting, and sad.

The article is a bit misleading in saying the 1st store was in Texas. That store was apparently Hinckley-Tandy Leather. I had thought the first Radio Shack store was in Boston, and a visit to http://radioshackcorporation.com/company/history.php confirmed that fact. Of course Tandy bought Radio Shack in the 1970s.

We have a Radio Shack over in the next town (Windham) that is an independently-owned store. He's a bit of an old radio affectionado (not nearly as seriously afflicted as most on this list, however ;-)), and always has some sets from the 40s through the 60s for sale in a corner of his store, as well as a huge collection of old vinyl (records). Next time I'm in there I'll ask about the future of his business.

Yes, it was in Boston, on Washington Street.
Sad to see them go, but they stopped appealing to hobbyists and became a phone and toy store. I pretty much gave up on them when they stopped selling well made ~$6 per pair audio cables and only sold ~$60 per pair “gold plated” audio cables!

Like Ron Roscoe, the Shack became too expensive for what you get. I go for the small parts, and for those it became the "we don't have it shack". I was wanting a mini jack to mini jack 8 foot jumper. Found it--$18. Dismayed at the price, I check the price on 2 mini plugs and 8' of audio coax to build it myself. That came to $16. Sadly, I bought the ready made jumper. I gave up on them. As per K2TQN, I'll have to stop by one last time.

Larry is correct. The first Radio Shack was in Boston at 167 Washington St. It was started in the 30s by Tobe Dautchman (Sp ??) and several others as a stocking distributor for all types of radio and other electronics parts. I first went there in the 40s. After WWII they rented the building next door for their surplus stuff. Talk about a kid in a candy store! Surplus of every description in one store and all manner of "new in box" radio parts in the store beside it! WOW! I still have a couple of my purchases. Wish I had more.

Sad and totally unexpected news. Unfortunately, my wife and I will be in New Jersey for Christmas. :-(

Lauren was a GOOD man and an inspiration to so many. He, Lincoln, Bruce and George--the founding Fathers of the AWA--are now all gone. A real milestone has been silently reached. I wonder what they will do together in Heaven? No doubt all of the Sparks are flying in joy for them.

This comes as sad news in what should be a joyous time of the year.

Back in the early 70's we learned much about the development of the vacuum tube and history of early wireless from Lauren. He was one of the original AWA members who took the time to help the new collectors.

He will be missed.

As a brand new collector to my first few meets at Canandaigua Lauren took the time to welcome me an answer questions. He always remembered your name and welcomed you each and every year to the AWA Convention. Joyce was also one who made you welcome. I miss those great Canandaigua meets, the great people who ran it, and the way AWA was back then. It was the national convention and they made it feel like a small home town gathering. They will all be missed and left an indelible mark on our gatherings. RIP

Thanks Mike, At 85, i feel a little old , esp. since i am the only one of those left. Years ago, on a Monday after the AWA meet, Bruce drove me, Woody Wilson and Joe Horvath down to Lauren;s home for a visit. Good times.

Lauren A. Peckham
Obituary
Peckham, Lauren A.

Breesport: Age 78 of Ormiston Rd. Breesport passed away unexpectedly on Fri. Dec. 19, 2014. Lauren was born Dec. 22, 1935 to Augustus Newton and Dona (Colebrook) Peckham. He was predeceased by his wife of 46 years, Joyce (Weitz) Peckham in 2004. He is survived by his wife, Julia (Leet) Peckham; sons, David and Cathy Peckham of Horseheads, NY, Kent and Christine Peckham of Statesville, NC; grandchildren, Andrew (Rose) Peckham, Nathaniel Peckham, Anna Peckham and Kyle Peckham; Brother, Darrell Peckham of Weedsport, NY; and a host of caring church family, friends and neighbors. Lauren was a lifelong member of the Horseheads First United Methodist Church. Mr. Peckham, along with his son David, own and operate LA Peckham and Son Pipe Organ Service operating in the area since 1971. He was a longtime member and past president of the Antique Wireless Association, member of AMICA - Automatic Musical Instrument Association, and was active with and instrumental in refurbishing the original theatre pipe organ in the Elmira Clemens Center. Family and friends are invited to call at Chapel of the _First United Methodist Church_
(https://givalike.org/dm/Lauren%20A.%20Peckham/R/2266516/Nonprofit-Directory/Religious/1617981/First-United-Methodist-Church-in-Horseheads?eqg=1)
1034 W. Broad St. Horseheads on Tuesday Dec. 23, 2014 from 10am - 12 noon. A Celebration of his life will follow there in church at 12 noon. Family and friends are also invited to gather for a time of fellowship in the adjoining fellowship hall of the church immediately following his service. Interment in Madison Cemetery, Madison NY. In lieu of flowers, those wishing may express their sympathy with memorials in his name to the _First United Methodist Church_
(https://givalike.org/dm/Lauren%20A.%20Peckham/R/2266516/Nonprofit-Directory/Religious/1617981/First-United-Methodist-Church-in-Horseheads?eqg=1) , 1034 West Broad Street, Horseheads, NY 14845. 13530. Re: [AWA] Lauren Peckham

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2014-12-21 20:03:07 UTC
From: Bill Fizette
Topic: 13517 Message: 13530

Lauren and Joyce were members of the "first wave" of members who assisted in large measure in promoting and growing the fledgling AWA. They were helpful to everyone who crossed their paths, including the writer, who benefited from their experience and expertise for many years. There are, sadly, only a few of this early group now left. Echoing the prior messages, Lauren will definitely be missed, both from personal and technical standpoints. He possessed a wealth of specialized knowledge, and was a friend of everyone.

Funny that you should ask . . . The last complete index was the one that ran through 2005. For the 2006-2014 era, I have the "Author" section in good shape. Now for the detail-rich main section. Will report results upon completion.

Subject: [AWA] AWA Journal Index?

Each January AWA Journal has an index for the previous year. Is anyone aware of a cumulative index covering several years? Beyond hard copy, is there one on the web someplace that is searchable?

Folks just thought you all should know.

Lauren was a good friend and will be missed.

Geoff Bourne

Lauren A. Peckham

Obituary

Peckham, Lauren A.

Breesport: Age 78 of Ormiston Rd. Breesport passed away unexpectedly on Fri. Dec. 19, 2014. Lauren was born Dec. 22, 1935 to Augustus Newton and Dona (Colebrook) Peckham. He was predeceased by his wife of 46 years, Joyce (Weitz) Peckham in 2004. He is survived by his wife, Julia (Leet) Peckham; sons, David and Cathy Peckham of Horseheads, NY, Kent and Christine Peckham of Statesville, NC; grandchildren, Andrew (Rose) Peckham, Nathaniel Peckham, Anna Peckham and Kyle Peckham; Brother, Darrell Peckham of Weedsport, NY; and a host of caring church family, friends and neighbors. Lauren was a lifelong member of the Horseheads First United Methodist Church. Mr. Peckham, along with his son David, own and operate LA Peckham and Son Pipe Organ Service operating in the area since 1971. He was a longtime member and past president of the Antique Wireless Association, member of AMICA - Automatic Musical Instrument Association, and was active with and instrumental in refurbishing the original theatre pipe organ in the Elmira Clemens Center. Family and friends are invited to call at Chapel of the First United Methodist Church 1034 W. Broad St. Horseheads on Tuesday Dec. 23, 2014 from 10am - 12 noon. A Celebration of his life will follow there in church at 12 noon. Family and friends are also invited to gather for a time of fellowship in the adjoining fellowship hall of the church immediately following his service. Interment in Madison Cemetery, Madison NY. In lieu of flowers, those wishing may express their sympathy with memorials in his name to the First United Methodist Church, 1034 West Broad Street, Horseheads, NY 14845. And Clemens Center PO Box 1046, Elmira, NY 14902. Condolences and remembrances' at Barber Funeral Home Inc. | Horseheads NY funeral home

Wow, how sad, I recently stopped and the AWA museum when driving home from Buffalo on the day they got that huge storm in November and we were avoiding the closed thruway and took Route 20 home, and the most interesting and knowledgeable man took great care and time taking us on a tour of the museum. I was really grateful not just for his knowledge, but for the time he took to explain everything especially to my teenage boys that I am trying to get interested in amateur radio. I don't remember his name just now, but I think it may have been Lauren. If so I am grateful to have met him and had my family benefited from his knowledge and enthusiasm for radio.
If not, thanks again to the man that gave us that tour.
Rest in peace Lauren and 73, Tom Bewick, K2BEW

SAQ transmission on Christmas Eve

There will be a transmission with the Alexanderson 200 kW alternator on VLF 17.2 kHz from Grimeton Radio/SAQ on Christmas Eve, Wednesday, December 24th, 2014.

The message transmission will take place at 08:00 UTC (09:00 local time). The transmitter will be tuned up from around 07:30 UTC (08:30 local time).

There will be activity on amateur radio frequencies with the call SK6SAQ on any of following frequencies:
- 3,755 SSB
- 7,035 CW
- 14,215 SSB
- 14,035 CW

QSL- reports on SK6SAQ are kindly received:
- via SM bureau or direct to Grimeton Radio

QSL-reports on SAQ are kindly received via:
- E-mail to: info@...
- or via SM bureau
- or direct by mail to:
Alexander - Grimeton Veteranradios Vaenner,
Radiostationen, Grimeton 72
S-432 98 GRIMETON
S W E D E N
The radio station will be open to visitors. No entrance fee.

Also read our website: www.alexander.n.se

Yours
Lars Kalland SM6NM

Date: 2014-12-22 22:41:19 UTC
From: w0vlz@...
Topic: 13508 Message: 13537

Ludwell,

Where can I find the 2005 index? It didn't seem to be published in any of the 2006 OTBs.

As a band aid I've found a title only OTB/AWA Journal index covering 1960-2011. It is part of each of the OTB/AWA Journal Back Issue CDs available at the AWA Museum Store (I need someone with the Volume 3 1997-2011 CD to check that the index is on that CD following the precedent set by Vols 1 and 2).

I've emailed Marc Ellis asking if there is any plan to put this index on the 'net and, if not, may I have permission to upload the index.

Niel - W0VLZ

Well, we're talking about the stand-alone index announced in the Jan. 2006 "Journal," p. 25, covering everything that AWA had published from 1960 through 2005. I'm developing a follow-on covering 2006 through this year. Will say more when there's more to talk about.

Greetings. Just got back from a weeks long vacation to toasty warm Puerto Rico were it was 82F every day, and below zero at home :) The other day there was a 96 degree difference between Puerto Rico and home, yikes.

Here is the latest email and snail mail log list for the BK 29. Check for your call sign to make sure I got ur log. If you haven't sent in your log, please do so. In a few weeks I will be sending in the list of W2ICE/0 contacts to Ed Gable. If you want a real W2ICE Bruce Kelley QSL card for your QSO with W2ICE/0, send an SASE with your QSL card to Ed Gable in c/o W2AN at AWA headquarters.

Several people have emailed saying the BK 29 contact info and log sheet template wasn't on theAWA webpage any longer. I looked and agree. Tim W1GIG checked into it and found that the web master pulled it down a bit early. He will put it back up for a few more weeks. Hope to see alot of the guys on this list on the Linc Cundall next weekend. 73, Scott WA9WFA

The editor of our Journal has told me that the Winter issue has been delayed to the point that it will miss the event. Therefore I am using this way to try to get to as many hams as I can. Please see the AWA website which contains the same material that you would expect to find in the Journal.

Good luck and lets fill the air with the mellow sounds of Antique Modulation!

Tim Walker, W1GIG

Ron,

Pages 2 and 4 are duplicates. Nice collection, however.

73,
Barry

Not yet, what you're looking for as I am is a Century buzzer,
they're black with "Century" in gold script.
I have 3 different buzzers but none fir the recessed hole for it.

I've been watching ebay for one, sometimes you'd see them mounted
on boards with early keys I guess for a code practice buzzer (oscillator).

The buzzer and a binding posts is all I really need, plus the box which
I'm planning on trying to build myself, I got a Porter Cable dovetail
jig for xmas from the XYL, when it warms up enough I'm going to buy some
wood and start practicing... :)

It was also at a time when manufacturing barriers like a minimum wage did not exist, nor OSHA safety requirements. After viewing the film, how many safety issues can we spot today? These working conditions presently exist in China.

For China, the most significant barrier is the transportation of goods to the U.S. It is interesting that the economics make sense when transporting consumer goods half-way around the world, but not in our own back yards.

Topic: 13582 Message: 13582

A friend of mine is looking for sources of information about I. M. Onderdonk.
Can anyone in this group help?
ThanksTom
==========

This is one of those things that you'd think you could find easily on the Internet, but so far I've come up empty.
The fusing current for a given wire gauge (the current which will melt the wire) is given by an equation derived by a gentleman (I am assuming it was a gentleman) named I. M. Onderdonk. I don't know when or where Onderdonk lived, nor when he published his equations. I can't find any biographical info on this person. Given the wealth of such info on the Internet today I find that somewhat odd.
Does anyone know anything or have any sources of info about this person?

Great electronic reference I find it handy on my cell phone to read on the little screen as the wife shops!
The graphics are pretty rough in these files which bothers me though.
I had a cd around here of rad labs too I will have to see if these are the same files and graphics quality.

I really prefer the bound volumes though for leisure reading! (and for photoing pictures out to print for use in displays here) We have 2 sets plus some spare volumes one set we handle the other set is holy... they were owned by many of the people that participated in developing the technology... so it does not get handled (much)

If anyone is building a set of the hardbacks an is missing a volume we may have some extra volumes to swap for other things.

same thing with bell system tech journals and RCA Review as well. Select extras - Drop me a note off list
also DATAMATION and many other journals as we sort things... we just bought stuff when it was there so thus some duplication... we still have this purchasing policy still too.

13587. SW-3 with #58's vs. 6D6

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2015-01-25 05:15:07 UTC
From: Chris Maness
Topic: 13587 Message: 13587

I have an SW-3 with 6D6's and just won an SW-3 with #58's in the lineup. However, it doesn't have a doghouse power supply with it? My 6D6 version PS I assume puts out 6V for the filaments. Is there a tap on the PS xformer for 2.5V? I am thinking I might be able to make up a chord and build a separate 2.5 VAC supply for the #58's. I guess the easier solution would be to drop in two 6D6's and a #76 because I believe the electrical characteristics are identical otherwise.

Also, the guy said that they are all #58's. I think he might be mistaken as the audio tube is a triode.

Thanks,
Chris

Thanks Chris, my phone truncated it.

I recently read Brown's Radar History of WWII. Excellent, but pricey. It reminded me of the Rad Lab set we had at NOV Tuboscope. They were in the library and could be checked out, when the last oil crunch came, the librarian/secretary was let go and they began to disappear. I knew someone offered them on CD as PDF files, then found this reference. It was interesting that they were trying to use vacuum tube detectors until they remembered the old crystal detectors, went to packaged diodes and got much better performance. I had one of the 1N21 series (I think) with the gold pin on one end and band on the other, ceramic body. The coupling of guns to radar was quite advanced. They did pretty well on the V2s, not so well on Kamikazes. The development of the proximity fuse was almost unbelievable with 1943/1944 technology. They were giants.

Thanks to everyone that came to the meet yesterday. Looked to be the largest group at this meet in a few years. Only 2 of 60 donuts were left over, glad they were well liked. I received an email from Johnpaul Harris he loss a envelope with some sixteen QSL cards inside. I did not find this when I cleaned up Sat afternoon. Please get with me if anyone else did find this. kirk

OK it looks to be wet but not freezing so the meet is on. Gates will not open till 9:00AM, free coffee and donuts while they last. Kirk

Forecast looks good for this Saturday . Gates do not open until 9:00AM. Free coffee and doughnuts while they last. No charge to buy, sell ,or trade. Lots of table space. Hope to see you there, I will send out another email Friday, but the forecast is for a nice cool day for this Saturday. Kirk Cline. PS I will not be bringing all of my tubes, if you need any tubes please email me direct with your needs.

Unfortunately, the doghouse supply you have doesn't provide 2.5 volts. You are also correct, the third tube is a triode. You might look at swapping the 6D6s from your receiver into the one you just got. It seems that the 6D6 has a bit more gain. Going from a faulty memory here.

Thanks, I will probably just buy some replacements. Someone restored the one that I already have, but they did such a nice job it looks brand new. The SW-3 that is coming looks like it hasn't been touched since the day it was taken out of line. I actually prefer the patina (aged) look. The nice thing is that it comes with 40m coils. The one I have just has bandspread that covers 2.5 to about 6Mhz. I was not looking forward to hand winding the coils myself. I have two pairs of blank forms. The instructions I have are not very clear which means trial and error, and I just don't have the time to mess with it right now.

I was thinking building a replica Utah Junior to go with the SW-3. I think that would be a kick of a station to run. The only thing is those round crystal holders don't come around too often.

13594. Fwd: Bolinas Antenna Damage - MRHS Newsletter No. 50

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2015-01-26 18:36:25 UTC
From: Bill Stewart
Topic: 13594 Message: 13594

Good Afternoon all,
I am forwarding this MRHS Newsletter to the list in case some may be interested in reading about the antenna damage at KSM/K6KPH-Bolinas. As you may know this is a mostly volunteer/donation supported on-going project. If you can send along some monetary support to help in the antenna repairs, I'm sure it would be greatly appreciated. Also, note later in the Newsletter, that the MRHS has been granted use of 512khz. It is really a thrill to hear KSM transmitting again on their assigned coastal frequencies...some of which are down due to the antenna damage. Give 'em a listen and send in a report.

Thanks...73 de Bill K4JYS

> Bolinas Antennas Suffer Heavy Damage in December Storm

During a severe storm on 12 December the antennas at the transmitter site in Bolinas suffered heavy damage. As a result several KSM and K6KPH transmitters are off the air until further notice. This includes transmitter A7, the 500kc/426kc transmitter

Here's a report on the damage by Transmitter Supervisor Steve Hawes

(EDZ = Extended Double Zepp antenna)

On Saturday morning, Bob V and I inspected the situation. Yes, the MF antenna was down.

Downed pole that held one end of the Marconi T MF antenna

From the paved road to Bldg 1, and standing in front of Bldg 42 (the tuning shack) we could see that the ant line was still attached to the West pole and ran through the brush, across the road and continued to the east. The line was no longer attached to the feed point of the pole by bldg 42 The line is about 3 feet off the road surface where it crosses and had been marked with yellow safety tape. We returned to the building and proceeded to bring up all transmitters.

Problems were noticed as follows:

Tx A1 3550kc Very high reflected power.

Tx B3 8438.3 High reflected power

PW-15 12B 12993 high reflected power

Tx D4 21050 had high reflected power

A couple other transmitters had marginally high reflected power.

Around 1300 we went into the South antenna field to check the situation. We did not observe any twisted transmission lines, but saw the following:

The 4216 EDZ antenna, used on Tx A1 (3550) was down and draped over several feed lines in the South antenna trunk.

The antenna feed point was tangled up in the H-frame and there were broken wires.

We proceeded to cut the 4216 antenna line in several places (immediately adjacent to the insulators) so the wires could be pulled off the feedlines. Then I observed that the common support pole for the 4216 antenna and the MF antenna (this the the farthest West pole in the first row) was ON THE GROUND. The 4Mc and the 500kc antennas appeared to still be connected to the pole. We had to cut the steel support cable for the MF antenna so we could clear another set of feed lines. We did not have time to examine the pole.

The pole fell approximately to the North. Parts of the 4216 and are still up in the h-frame. Following the above work, all of the still operating transmitters had nominal reflected power. There are now 3 antennas down and out of service: The MF antenna is still connected to the feed wire, but most of the antenna is on the ground. We did not have time to pull it up off the road.

The feed wire is hooked over one of the climbing steps on the feed pole by the tuning house and it would probably be easy to pull enough of the ant wire down the pole and tie it off, to get the west ant section to clear the road.

The MF antenna appears (I think) to be intact, except for the support at the top of the feed pole (broken insulator?) and the steel support cable at the east end that we had to cut to clear feedlines. (Possible quick fixes-Re hang the West section from the tuning house pole to the West pole and have a temporary "Inverted-L", or find another pole in the general direction of the east pole to support the east end of the MF antenna. (until the fallen pole can be replaced or hell freezes over, whichever occurs first.)

The 4216 ant is down and in pieces. The 8247 EDZ had been down for some weeks. KSM is off the air on 426/500 CW and 8433 NBDP. K6KPH is off the air on 3550.

As you can see, we face a daunting task. And this does not include the antenna maintenance required at the receive site where, thankfully, the antennas survived the storm. Can you help with this giant task? Lots of True Believers have already contributed to the antenna repair and restoration fund, and for this we offer sincere thanks - but clearly we now have more work before us than ever before. If you can help just click on the button below to make a quick and easy donation.

Make a Donation

Thanks!

> MRHS Granted 512Kc!

We suppose there's some irony here with the Marconi T antenna on the ground, but the Federal Communications Commission has granted KSM, authorization to use 512kc.

Old timers and those familiar with maritime Morse communications will recognize 512kc as the frequency to be used when 500kc is occupied with distress communications. Part 80 of the FCC rules permits this frequency to be assigned to coast stations in the maritime mobile service.

The MRHS applied for this frequency as a sort of lifeboat channel.

We consider 500kc to be the most historic frequency in the radio spectrum - a sacred spot on the dial. 500kc was the center of marine communications for decades. Coast stations constructed elaborate antennas for 500kc. They used tens of kilowatts of power, their signals spanning the oceans on cold winter nights. Hundreds of well trained ears, ashore and afloat, monitored 500kc twenty-four hours a day. The mundane routine of maritime commerce was heard on 500kc - until those most electrifying three letters in radio, SOS, rose up out of the static, a plea for help from a mariner in distress upon the sea. Then all normal operation ceased as operators pressed the earphones close to gather in every word from the distressed vessel.

KSM still stands watch on 500kc. Our operators scrupulously observe the silent period twice an hour. It's a tradition going back to the early days of radio history. But there are forces at work that may eventually threaten 500kc. There's talk of an augmented NAVTEX system planned for the frequency. Others may have other ideas.

We plan to continue operation on 500kc as KSM and KPH always have. But if the day should ever come when the sacred frequency, and the memories of the men and women who used it in their hour of need, is sullied by the presence of another service, well, at least KSM will have a place to go to carry on the tradition and keep the faith with those who came before us.

We have to activate 512kc within 12 months of the grant. Even now the MRHS Transmitter and Maintenance departments are poring over blueprints and exercising their slide-rules to determine the best way to do this. It's not a matter a spinning a dial and tuning up on the new frequency. Even though the new frequency is only 12kc away from 500kc, that's a big percentage move. We're dealing with a new, high stability exciter frequency and tuned circuits in multiple stages - plus the antenna tuning unit in the tuning house at the base of the Marconi-T antenna.

KSM's transmitter A7 may be used on 512kc

One possibility is to use existing 5kW transmitter A7, a Henry MF5000D. Or we may restore another MF transmitter specifically for 512kc. We have two Harris 5kW MF transmitters from KFS, one of which is even now being restored to service. being restored. Either way, when we are ready to begin testing on the new frequency we'll let you know so you can monitor and provide us with signal reports.

> Frank Geisel's Report No. 2 - March 1946

In Newsletter No. 49 we presented Frank Geisel's KPH report for January 1946, soon after the station resumed operation after the war. This turned out to be a hit among True Believers who asked that we continue the feature. So... let's take a look at what FG had to say in his February, March and April 1946 reports.

In his report dated March 2, 1946 (for February) FG mentioned composite transmitters 78 & 79. We have the control panel for one of these, donated by Denice Stoops after it adorned her bedroom wall for decades! FG also archly complains that the Matson liner Monterey , a RCMA ship, has been giving her traffic to competitor KFS!

During March FG reported that the KPH 126kc transmitter B11 (apparently different from BL11) was returned to service (the 126kc authorization is still part of the KPH license) for paid press and traffic lists. Both the Western Union teletype circuit and the transmitter control cable failed. RCMA ships Mariposa and the "presumably reformed" Monterey continue to use KFS. FG took a week of sick leave.

In April FG reported that ex-KHK 2kW transmitter was placed in service but it proved problematic. Ships "in the Orient" reported interference to the KPH 8420kc signal from an unknown teleprinter transmitter and parasitics from NPO. Matson liners Mariposa and Monterey , RCMA controlled ships, continue to use station KFS of arch rival MacKay Radio, costing "hundreds of dollars" in lost revenue. Western Union is routing KPH messages to KSE (RCMA station in Southern California) which then must relay them to KPH. KPH had lots of traffic for government MST ships but they were not contacting KPH to get it. FG asked KFS operators (!) to tell these ships that KPH was holding traffic for them but "cooperation in

this respect depends on the operator on watch". We'll bet!

> Mini Night of Nights Report

As announced in Newsletter No. 49 , at the end of October 2014 the MRHS participated in a MF-oriented "Mini Night-of-Nights" event in cooperation with Dr. Fritz Raab. Here's a report on the evening from Roy Henrichs of the MRHS Operations Department:

I can provide details of our MF activities for that day, as I was the commercial operator on watch. Activities are documented in KSM logs, which are maintained at the station - I do not have those here at home, but do have my notes from the evening.

KSM followed our standard published operating schedule until normal station close (0100Z). From that time until final close (I do not have actual time here), we provided continuous press and NOAA weather broadcasts throughout the evening. These were announced on 500 kc (CQ) immediately before beginning of each broadcast, with PX/WX broadcasts taking place on 426 kc.

KSM maintains a continuous efficient watch on 500 kc at all times of operation. However, no experimental station transmissions were heard on 500 at any point during the evening. We did, however, delay one of our 500 kc CQ's due to likely infringement of ISP. QRX notice (wait) was sent on 426 at conclusion of the prior PX/WX broadcast, with reference to ISP, for benefit of our listeners.
We at MRHS regard 500 kc with a geat deal of reverence, in respect of its historic use - and are pleased to report that experimental stations appear to have treated that frequency with the respect that we believe it deserves. We continue to encourage use of 500 kc in its historic context as a distress and calling frequency, including observation of the historic international silent period (ISP) - and trust that experimental stations will continue to follow our lead in that matter.

With 500 kc apparently silent, I spent much of the evening tuning the band for experimental stations. 500 kc warch continued during this period (dual receivers used).

At approximately 0303Z, I heard WG2XSV (Vancouver, WA) on approximately 474 kc, QSA2 QRK3. I also heard WD2XSH/20 at the same time on the same frequency, QSA5 QRK5. Sent email to both ops, and received responses from them at our radiomarine.org address.

I also took the initiative to provide reception reports for these stations on 500 kc CW at the beginning of one of our PX/WX broadcast CQ's, with statement that we would follow up by email. This in recognition of the experimental MF station effort and our participation in same by listening for these stations.

Our listening efforts were somewhat limited by our own 5KW signal (from less than 20 miles away) hitting our receivers hard. Also, I heard what appeared to be weak birdies at various points in the MF band. Whether these actually were loe power experimental stations engaging in digital communicatons is unknown. Or, perhaps real birdies from local BC stations hitting our receivers - as we do not routinely listen to frequencies other than 500 and 425 kc.

I do recall an email comment from one of the stations I heard mentioning that he had not been listening closely for our broadcasts - probably was more focused on hearing/working other experimental stations. No problem, fully understood: makes sense! Please do not regard this as a complaint - I am just reporting a comment from one of the stations we heard.

I can tell you with 100% certainty that our operators really enjoyed working this special event. It was a very unique, extremely pleasant, and festive evening at KSM/K6KPH! And, we were pleased to work with your group to the extent that we could. Almost certainly would do this in future, if feasible.

> Get Your Radiotelegraph License Endorsed at KSM

As always, we offer holders of commercial radiotelegraph licenses the opportunity to sit the circuit at KSM and have their licenses endorsed as commercial operators. As holders of these licenses will be painfully aware, there is no longer a space on the back for a service endorsement. However the MRHS management has at great expense invested in an official MRHS endorsement stamp which will be applied to the rear of the license, the information filled in with a genuine mill typewriter and signed by the KSM Chief Operator. With this you will be suitable for employment at any US commercial Morse code coast station.

What's that? You say you don't have a commercial radiotelegraph license? Well, the MRHS is ready to help you out in that department as well. Check out the article below.

> Radiotelegraph License Exams Available Through MRHS
First exam scheduled for 7 February

Here's the information from Roy B. Henrichs:

In Newsletter No. 49 , I reported that MRHS would soon begin administering FCC Radiotelegraph operators license examinations, as we had entered into an agreement with the W5YI Group to do so - and, at the time of publication, were awaiting receipt of credentials and license examination materials from the W5YI Commercial License Examination Manager (COLEM).

I am pleased to report that all required materials and credentials now are on hand - and that we now can schedule the first examination session. Since the holiday season is in full swing, and because examinees will need reasonable time to prepare for the exam, we have scheduled our first examination session for 10:00 AM, Saturday, February 7th, 2015, at the Point Reyes Fire Station, 4th and B Streets, Point Reyes Station, CA.

True Believers who intend to take the exam on that date should contact Roy Henrichs via email: wb6ovv@arrl.net in advance, so that we can prepare for your arrival. While advance notification is preferred, we can handle you on relatively short notice - but do need to know your plans because we will need to print your examination before the day of the exam.

If, for some reason, that date does not work for you - please be advised that we plan to offer examination sessions on roughly a quarterly basis. And, possibly more often if there is sufficient demand.

Newsletter No. 49 outlines the examination process and provides basic information concerning the exam. Please note that examination fees for the elements you plan to take must be paid at the time of the examination, by money order or certified check payable to the Maritime Radio Historical Society - or in cash. Please do not send fees in advance; that keeps things simple for all of us, should last minute circumstances prevent you from attending.

The original plan still holds: pass your examination in the morning, and get a Proof of Passing Certificate (PPC). You immediately get full bragging rights for passing this

penultimate examination - and, then can come out to the station, tour the facilities, and sit the commercial circuit for the first time that afternoon! File your PPC with the FCC on the specified form (which we will provide), and get your permanent license from the FCC by mail.

It simply doesn't get any better than that.

So, the next step is up to you. Let me know if you have any questions . . . and, we look forward to having you on board soon!

73,
Roy Henrichs

> Radiotelegraph License Exams in the Portland Area

OM Bass wrote with this information for those in the Pacific Northwest:

I am an FCC examiner (with National Radio Examiners) and I administer the FCC exams. If any of your members live in the Portland, Oregon Area I can administer the FCC examinations.

I live just six miles south of Portland in Milwaukie, OR. My phone number is 503-860-3777.

I do the exams on a request basis. Individuals can call and set up an appointment anytime during the week day.

The Radiotelegraph Operator License is a lifetime license and requires written exam of FCC elements 1 and 6, and telegraphy elements 1 and 2. Telegraphy exam element 1 consists of copying code at 16 words per minute (Five letter/number code groups) and element 2 consists of 20 words per minute, Plain language.

The cost is $125.00 for FCC Elements 1 and 6 and Code elements 1 and 2.

It should be noted that the radio telegraph license is not usable for repairing or servicing the new GMDSS (Global Maritime Distress and Safety system) radio equipment. It requires a FCC GMDSS Maintainer License. Operating the radios requires a GMDSS Radio Operators license.

Added information.

I was a Radio officer serving on Military Sea Transportation Service in the early 50's and served using CW. I do recall working a Russian station in the sea just off Alaska. As a young and "smart" radio officer I had the speed key out and decided to pass some traffic his way. He returned my "call up" so fast it sounded like a single tone. I sent a QRS (send slower) and put away the speed key for the rest of the voyage. Some people never learn!!!

In the early 90"s I was working as a Electronics/Radio officer for the Military Sealift Command (the new MSTS) and most traffic was sent via satelite. That was the day that the equipment malfunctioned and we needed to pass traffic to the Navy department re the equipment failure. So as we were in the Med a call to Radio Casablanca was in order via CW. BUT there was no hand key for the equipment. The Engineering department of the ship built a key from a few screws and part of a hack saw blade. The message was sent and I still have the "Key." You never know when CW will be needed.

Maybe more later as this old mind recalls some of the unusual conditions on board the "Code" ships!

> Matson Navigation Company Needs REOs!

Yes, we hear it all the time: "What good is the radiotelegraph license? Nobody's hiring radio officers anymore!" Ah, but that's where you are wrong my friend. Radio Electronic Officers are in demand at Matson Navigation Company - and possession of a commercial radiotelegraph license is one of the requirements! Copy this from the current REO aboard Manulani:

MANULANI REO

Jan 11, 2015

We are currently short of R/O's due to picking up Jobs on the Watson Class MSC ships.

The Matson ships require the R/O endorsement On your USCG papers, along with several computer certifications Network+ A+ and Security+ or their Microsoft equivalent, evidence of Electronics training and Radar endorsement/experience are also required.

The Watson Class ships also require a Windows Server Admin cert and security clearance. The best part is 26 days paid vacation for 30 worked. If you have any interest or know anyone who might contact our Secretary treasurer Mr. Cliff Walker. It's mostly a computer/electronic tech job today, with about an hour a day for GMDSS tests.

V. Cliff Walker

American Radio Association
Secretary - Treasurer
1600 Rabke Rd.
Canton, GA 30114
walker@araunion.org
770.592.3232 Office
678.522.7363 Cell

If you apply please keep us informed on your progress! And if you can figure out where to connect a key to the GMDSS console you can use KSM to send your traffic!

> Job Opening at the MRHS

We need to be clear about this - we're all still volunteers when it comes to the restoration, maintenance and operation of KSM and all the other MRHS projects you have been reading about. However the Point Reyes National Seashore has initiated a multi-year project to conduct a complete inventory of all the equipment and artifacts at both the transmit and receive sites - a titanic job as you can imagine. They have actually provided a budget for this project and part of that budget is earmarked to pay personnel.

Job title: Collections Inventory Assistant
Location: KPH/KSM receive site, Point Reyes, CA
Hours: 20-30 hours a week, M-F
Pay: $10/hour

Interested? Great! You'll get to hang out at a beautiful location, work with great folks conducting an inventory of classic radio equipment - and get paid! Just click HERE for full information and the job description.

> MRHS Merchandise

Support the MRHS and look cool at the same time. Such a deal! We've got hats, mugs, T shirts, belt buckles and bumper stickers, all with variations of the MRHS logo. Get a hat and mug for yourself and a put yourself in solid with the XYL by getting her a MRHS hoodie.

Plus you'll want to be looking sharp when you visit us on Night of Nights. No better way to do that than to be rocking some MRHS swag.

Click on the images to go to the True Believers Store

Just click on the images above to go to the MRHS True Believers store and browse our offerings. Thanks!

We hope to meet you on the air or in person at KSM. Until then we wish you the best of luck and fair winds & following seas.

73,

MRHS

OK, have watched the first half of this program so far....

Only took about five minutes for me to start twitching and making little grunting noises.

I'm glad they are on the subject of Edison, but research on the photos.... GEEZ !!!

Talking about 1869 and cutting to a photo of young David Sarnoff at the Wanamaker Station in 1912 ???
Land line telegraph keys arcing like primary keying of a little E.I.Co. spark coil ???
Talking about the 1870s and showing clips of circa 1910 locomotives ???

I could keep going, but I won't.... Sigh.....

Interesting that Tesla was not mentioned in regard to the
Westinghouse AC competition.
And, while it mentioned that he grew up in Port Huron, MI, his first
seven years were
in Milan, Ohio. His birthplace home is still there and used as an
Edison museum.

I'm sure it's tough to get all the details of Edison's life into a
few hours.....

The eBay seller did not correctly pack my SW-3 and the front dial came broken and bent. Is it possible to find (or does anyone on this group have a replacement? The rig is overall nice shape with beautiful crinkle paint. It would be a shame to part it out.

I think I am going to make a youtube video explaining how to pack an antique radio and make people I buy it from watch the video. This is the second radio I have received smashed. It was in a small box with air bladders.

Regards,
Chris KQ6UP

13606. AWA AM QSO Party this weekend!

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2015-02-05 21:41:58 UTC
From: Larry Szendrei
Topic: 13606 Message: 13606

Hi, all.

The Antique Wireless Association is having its AM QSO Party this weekend from 2300Z Saturday Feb. 7th to 2300Z Sunday Feb 8th. This is a laid-back event; the minimum required exchange is name and QTH (and, presumably, callsign!), and you don't need to submit a log, just a brief summary. Of course, longer conversations about gear, etc. are encouraged and make it more fun. More details at:

http://www.antiquewireless.org/awa-amplitude-modulation-qso-party.html

I'll be operating from my Maine QTH as flagship station W2AN somewhere between 1880 - 1900 KHz between 6PM and 9PM EST. Please drop by and say hello.

73,
-Larry/NE1S

13608. SW-3 Version 1?

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2015-02-06 23:02:54 UTC
From: Chris Maness
Topic: 13608 Message: 13608

It turns out the SW-3 that I received damaged in the mail is the 1st version. The audio stage socket is marked 27. It had two 58's in the front, but I think those are the wrong tubes. The version that is supposed to have two '58s should have a '57 in the audio stage according to the literature folks sent me on this group. Am I correct?

Is this one anymore sought after than the later version? I think the battery version with two '32's and one '30 is the most valuable (scarce) version.

Thanks,
Chris Maness

From: Barry Williams
Topic: 13608 Message: 13610

Chris,

The 2nd version is the easiest to find. The first version is next. The one I have not seen is the 3rd version with octal tubes. I am pretty sure I have the part you need, hope to put hands on it tomorrow. I have 1st and 2nd versions. My 1st version has 24As and a 27. It was professionally modified, laced wiring harness, audio transformer added, dual phone jacks and a jack for the intercom, and B+ switch added. The switch allows swapping coils without turning off the power supply, the transformer takes B+ off the phones. I know some were modified by Pan Am, but don't have any information on their mods.

73,
Barry

13611. Re: [AWA] SW-3 Version 1?

Are you pretty sure Pan Am modified SW-3's ?
Pan Am had their own in-house built regenerative receivers, two dialers.
Alaska Steamship Co. modified some of theirs, but not to that extent; I think they only added one switch. Also, they modified, I think, only the LF coil. They used the SW-3 apparently only as their 600 meter traffic receiver. I think the Sargent 11 was their HF receiver. I have some radio service logs and ship radio logs from A.S.S.Co. from around 1935-36. (The ship radio logs are not that interesting, possibly because of the use of commercial codes which needed the company codebook to translate.)

From: Barry Williams
Topic: 13608 Message: 13612

Hue,

I don't know who did the mods. The wire is all cloth covered and nicely laced. I saw one picture of an SW3 on a Pan Am plane in the early 30s, but most pictures of Pan Am I saw were the two dial receivers that used the SW3 type dial. I understand that at least some South American countries required a CW transmitter/receiver. In the US, when radio communications were required, AM was the standard. I figured that the two dial receivers were for use in countries not requiring CW, and the SW3 might have been a CW stop gap receiver. There is also a picture of an airport communications room showing an SW3. I know the Navy shipboard RAS receivers during WW2 were fitted with audio transformers to keep B+ off the phones. This could have been modified for shipboard use, but is in quite good condition to have seen that service.

73,
Barry

The large overocean Pan Am craft were all equipped with those 2-dial receivers. I might have seen something similar in a photo of a Pan Am land base, in a book on Pan Am. All their overseas flights used CW.
Hmmmm.....wonder if I gave that book away? I can't place it right now....not sure i still have it.

Around 1977, I was working in an electronics surplus store in Seattle. A customer came in and was talking with Howard, the manager. The customer's name was Carl, and he was an insurance agent in Yakima, WA, and he'd picked up in Seattle a Pan Am receiver of this type. Howard or Carl told me Carl had been a Pan Am employee, he was kind of an 'old timer', altho I'd say at the time his age was no more than 55-60, I'd guess. Carl was a ham also, so maybe someone over in Yakima still remembers him. I wonder what ever happened to that receiver. It certainly would be great fun to use.

(The earliest aircraft radio I have is a U.S. Navy type ME-1 from 1929, 3-4 MHz with two crystal channel transmit and 4-tube regenerative receiver using WE-215 tubes.)

An acquaintance in California told me maybe 25 years back, a fellow showed up at a swapmeet there with a bunch of old Pan Am aircraft radios of this sort. They seemed to elicit no interest even at the modest asking prices, and he left with nothing sold. Those were never seen again, AFAIK.

I think the final version with octal-based tubes may be the rarest. I've never seen one.

Chris, The 2nd version is the easiest to find. The first version is next. The one I have not seen is the 3rd version with octal tubes. I am pretty sure I have the part you need, hope to put hands on it tomorrow. I have 1st and 2nd versions. My 1st version has 24As and a 27. It was professionally modified, laced wiring harness, audio transformer added, dual phone jacks and a jack for the intercom, and B+ switch added. The switch allows swapping coils without turning off the power supply, the transformer takes B+ off the phones. I know some were modified by Pan Am, but don't have any information on their mods. 73, Barry

I've been impressed by the early regen receivers. Even the simple Pilot Wasp. I have an AC Super Wasp set up and operational, as well as the SW3 v2. They are at their best with short antennas. The SW3 wins due to the band spread coils. I do like the separate RF tuning on the Super Wasp. The power supply for the SW3 was rebuilt using a VR tube, to regulate the voltage, pretty stable now.

Some early phones have exposed connectors. Be careful, as B+ is exposed there. I guess salt water and metal ships might be the reason the navy didn't want B+ on the phones. It is interesting that about half the RAS receivers appear to have not had audio transformers. There are 4 here, 2 with and 2 without, no obvious under chassis wiring changes to indicate they were removed from the pair without transformers.

73,
Barry

Hi, Chris,

As another has pointed out, the 58's would be wrong for the 1st version of the SW3, which used 24's, but one of the most common (2nd?) versions used two 58's and a 27. That is the version I have. It is more likely that you have this version and that it is stock, although I suppose it is possible that someone modified the 1st version to use a pair of 58's. The 58 IS a better tube than the 24, so it would have probably been justified, "back in the day." AFAIK the vernier dials between those versions are the same, but I'm not positive.

73,
-Larry/NE1S

Doed any one know when the translucent rear projection drum dial with the recessed celluloid screen was added to the sw3? Thats what i have. Has 58 tubes too. All else same. Works very well and dial gives great bandspread and redolution but cant find info on change. This dial used on other sets of the time. It is definitely factory. Perhaps a prototype of later set. 73 Karl WA2KBZ Sent on a Sprint Samsung Galaxy S® III

Have never seen an octal one either. The set here is the second big-pin version.

I wish Jim Fred were still alive and selling his repro 6-pin National coil forms. They made it easy to make broadcast coils for the SW-45: put a modern coil inside his form.

Chris,

I do not have the part you need. I have one that goes 0-100 in both directions, and one that is backwards. Didn't realize all the variations in the B dial.

By the way, my 1st model has 35s and a 27. 2nd model has 58s and 27.

Sorry,
Barry

Looks like a pretty nice offering there! No real junky junk, either.
I noticed a lot more military equipment than the last post mentioned.
RAX, RBS, several ‘Command Sets’, ME-61 for GRC-9, tube tester, maybe
others?
I wonder what the asking price for the Altair computer was. Never saw
one of those at any swap I have been to.
The display of large light bulbs with a few large vac tubes struck me as
just odd. I would think not very many shoppers looking for large glass
light bulbs there. Well, you can always offer, anyway.
Thanks for posting the photos.

Hello Chris,

I am sorry to see such damage to such a nice receiver. I was wondering if the dial still functions and if you would be willing to sell it?

I would like to use it on regen builds, built nothing that is period correct.

Tnx,

Robert

No, thanks. I believe the damage is only superficial, and I now have an exact replacement dial. It should be ok once the dial is replaced.

13630. Hollow-state negative voltage regulator?

Yahoo group: antiquewirelessassociation (2010 — 2015)

Is anyone aware of a vacuum-tube design for a feedback-controlled variable negative voltage regulator?

IOW, something that takes an unregulated voltage that is negative WRT ground and drops it to a variable, regulated less-negative voltage WRT ground? It does not need to source much current - say, only 5-10 mA - but should be able to maintain regulation when the "load" is sourcing current up to 30 mA or so. The application is a grid bias supply for a stage that runs into grid current.

A Google search for "vacuum tube negative voltage regulator circuit" only produced the typical positive voltage regulators.

I know, pretty easy to do in solid-state with PNP's or p-channel FETs, but this will be used in an all-tube project.

Thanks in advance for any leads,
-Larry/NE1S

Sure, that's easy - but I need a variable-voltage, feedback-controlled
regulator. I can't be constrained by the available regulator-tube voltages.

Thanks for the response, though.

Larry –

It seems you may be able to experiment with a triode connected such that the input to the cathode is your unregulated negative voltage and the grid input would come from the center tap of a pot which is across a VR tube also across the input. Then, the negative output would be off of the plate. Like I said, you would need to experiment, but, I think it is a simple solution for what you need. Depending on the regulation you need, you can also play with feedback from the plate back to the common grid circuit. Similar to a SS pass transistor case. 73 – Mike

There were many regulated bias supplies in the tube era. I have one in the shop, part of a Hewlett-Packard 712A power supply ca. 1962. I have posted the schematic to:

http://plymouthcolony.net/starcity/radios/images/temp/HP712ASchematic.jpg

Hi Dale,

Thanks for the response and the schematic, but while the positive output of that supply is electronically regulated, the-bias supply is not. The negative bias supply is just a 25K pot across a -150V VR tube, and it cannot source or sink much current unless the pot is full CW or CCW. In fact, that's exactly what I have in my circuit now, and it's not "getting it done."

But I appreciate the thought.

Strangely enough, in my application it's not any current I'm drawing
that's the problem. In the rig I'm building, the RFPA will source grid
current in both class C (CW & AM) and class AB2 (for SSB) modes. The
class C bias doesn't really need to be adjustable - its just for cutoff,
so a single VR-75 does the trick, and will handle the class C grid
current of 25 mA. But for class AB2 I need an adjustable supply capable
of maintaining the set voltage while sinking grid current - estimating
up to 40mA, to be safe, for the pair of tubes (4-65As).

I know how to do that with solid state, but have not seen it done in a tube regulator. Have you trolled through RDH4 to see if it can suggest anything? When I get a chance I'll have a look through my technical library. I don't think I'll find an answer in any of my broadcast transmitter manuals - those should all be AB1 modulators.

Thanks, Dale. Yeah, I looked at my copy of Langford-Smith RDH4 but
didn't see anything. One of the guys on another reflector pointed me to
a circuit on p241 of the 1950 ARRL Handbook that almost fills the bill -
it sinks (and sources) way more negative current than I need to, but
the voltage range is too limited for my needs. Those things could
probably be easily dealt with, but it seems like you ought to be able to
do the job more simply than that design.

I have an old homebrew (not by me) bias supply in the cellar built for a
similar application; I should pull that out and reverse-engineer it for
ideas.

I am getting several helpful suggestions.

Thanks again,
-Larry/NE1S

Larry -

Before I start digging what voltage range do you need?

This intrigues me. I don't have a good EE library in town, but there is one at a major university an hour away. I will be going through that town enroute to a job (and with time to spare in the library) in about 2 weeks. I will stop there if I can't turn up anything in my personal library of if nobody else comes up with a solution. BTW, that job involves some work on a 5 kW AM broadcast transmitter - the sole remaining tubed transmitter currently in my care.

If push comes to shove I will be at another major university for some medical tests in about a month (with some time to spare) and can dig in their EE library.

Sometimes I miss living in Amherst, MA and having the UMass EE library in town.

The range of -65 to -140V should do it - on the smaller (in magnitude)
range for class C operation of the PA, and the higher end of that range
for class AB2 operation.

But I think I found an acceptable solution very similar to what Mike
K6RRE suggested on the Glowbugs list using a triode as shunt regulator.
If you have a 1944 ARRL Handbook, see page 168. Very simple, and the
bias supply doesn't source much current, but the shunt tube sucks it up
when the "load" is delivering current.

If you do any of this, Dale, do it for your own curiosity, and don't go
through all the trouble on my behalf. I've gotten plenty of good ideas
at this point, and will probably do something similar to what I alluded
to above. I hope the medical tests, whatever they are, come out in your
favor.

Thanks, Mike. You as well as Richard, AA1P on the Glowbugs list essentially made the same suggestion, and I played with the schematic and figured it out yesterday. I'm just now catching up to respond to those that helped with suggestions.

In my case the positive side of the unregulated negative voltage supply is grounded and must remain so. So, in this case the positive input of both the circuits below is tied to ground, and the negative regulated output is taken from the cathode of the pass tube. This references the regulated output to ground not directly but through the unregulated supply, which is not great, but probably would work well enough. I agree the circuit with the error amplifier would provide better regulation; I have used it may times, but on positive supplies wrt ground. In my application the regulation could be improved by referencing the cathode of the error amplifier to the ground (through a string of Zeners or VR tube(s) rather than to the unregulated negative supply rail. There is a a negative regulated supply circuit that does this, for example, on P241 of the 1950 ARRL handbook, which I went looking for at Paul N1BUG's suggestion.

In the end I think I found an acceptable solution very similar to what Mike K6RRE suggested on Glowbugs using a triode as shunt regulator, and similar to your first schematic below. If you have a 1944 ARRL Handbook, see page 168. Very simple, and the bias supply doesn't source much current, but the shunt tube sucks it up when the "load" is delivering current.

73, and thanks for the help!

Big, I mean really BIG, article in the February 11, 2015 RadioWorld Magazine.

You won't want to miss this story about the 250kW Collins transmitter
which was saved from the scrap yard by the combined efforts of the
AWA (Antique Radio Association - http://www.antiquewireless.org/)
and the Collins CCA (Collins Collector Association - http://www.collinsradio.com/)

Online version -
http://www.radioworld.com/article/awa-saves-a-piece-of-delano-station/274511

This transmitter was rescued from the 'Voice of America Delano California Shortwave Station'
with the rescue crew given only about one week to remove it. A massive undertaking.

It will be on display in the new AWA Museum located in Bloomfield, NY.

You can help fund and be a part of this project by joining the Collins CCA, by joining the AWA, or...

Please consider a donation, no matter the size, to support our efforts.

Thought our members might find this documentary very interesting. Its about Gerald Wells in London England who was obsessed with radio from an early age about 7 until he passed at 85. Runs about 45 minutes and is absolutely fascinating to watch.

http://documentaryheaven.com/valveman/

The hosting web site (below) has thousands of documentaries on line, US and British. It's worth checking out. Good for educational benefits.

Wanted: Loop assembly for Zenith 54 or 60 series

Friends,

I am working on a Zenith 54 and have discovered the loop has been removed. I am looking for a complete loop assembly with all the brackets and wiring. This same loop may be in the 60 series models too.

The links below are pictures of what the loop looks like

http://home.comcast.net/~haney63/ut/Zenith_54_with_loop.JPG

http://home.comcast.net/~haney63/ut/Zenith_54_with_loop1.JPG

http://home.comcast.net/~haney63/ut/Zenith_54_with_loop3.JPG

I will pay ca$h for a complete assembly of this loop.

Thanks!

Charles

13663. AWA Surplus Items

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2015-03-19 20:52:27 UTC
From: Bill Stewart
Topic: 13663 Message: 13663

I read in the winter 2015 Journal in the 'Summary of Minutes' on page 8, that the AWA collection "cannot continue to grow at it's present rate. Non-essential and redundant items must be culled. Duplicate items are being sold on eBay and an auction is also being considered, in addition to the convention auction."

This brings up a couple of questions:
1. Why not list some of these items so that those of us not close to the HQ shack can have a chance at some of these surplus items. There oughta be a way that we could participate in the purchase of these items. Seems to me that the auctions are benefiting those that are fortunate to be close to the site and those of us in the boonies may be missing out on some nice parts, etc.
2. Also, does anyone know what the eBay ID is for the AWA. I would like to take a look at what is being sold and maybe make some bids.

Thanks,
73 de Bill K4JYS

Hello,

Can you look up richard tollison, columbia S.C. I have one of his ham radio auto license plate from the 60s. He also gave me his navy flameproof key.

I think his call is K4BSR. I don't have it in from of me now. There is no listing I can find on QRZ or Hamcall.

Thank you,

Robert S Jenkins

13674. Re:Callbook look - up

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2015-03-22 16:16:20 UTC
From: Adrian Flynn
Topic: 13667 Message: 13674

By any chance does anyone have call books for 63 to 65?
I am trying to refresh my memory on the dates on my novice call.

It should be listed as

Adrian Flynn
35 W. 10th Ave.
Mesa AZ.
85202 IIRC the zip

Rest is dead on.

I think I got the call around Aug 63.

Thanks for your time.

72/73
Adrian KF7DYU

Hi Robert

Dick passed away about 12 or so years ago. I helped his wife dispose of his ham gear a couple of years after that and gave her the money. I think that I saw where she passed away about two years ago. I believe that his daughter is still alive but don't recall her name. I don't think that she was married… Dick was a Dictaphone salesman early on and later a court recorder. His wife was a teacher and after Dick died I think that she run the business until. Sorry to bring the bad news…

Great film about the manufacture of crystals for the Signal Corps during WWII by Reeves Sound Laboratories:
http://hackaday.com/2015/03/03/retrotechtacular-crystals-go-to-war/

Be sure to read the comments after viewing the film - some good descriptions on the manufacture of color burst crystals in the 1970s.

Have fun,

Duncan

Which ones do you disagree with out of curiosity?

Hi Chris,

Here's the list of the ones I would debate:

1. Don't have it longer than 75 feet for sending out a 200-meter wave.
/(75 feet is only 0.11 wavelength at 200M and would result in a lot of ground losses. I suspect this was said because they really didn't understand matching back then and were simply trying to maximize the antenna current indication in the shack.)/

2. Don't fail to have the resistance of your aerial as small as possible. Use stranded wire.
/(The individual strands oxidize and actually have a higher RF resistance than a solid wire of the same material and diameter.)/

3. Don't operate a transmitting set without a hot-wire ammeter in the aerial.
/(The hot-wire ammeter introduced losses, and a temperature-variable resistance, similar to an indicator bulb, and should be shorted out after tune-up.)/

4. Don't use solid wire for connecting up the parts of transmitters. Use stranded or braided wire.
/(See #2. above. By the late 1920's solid buss bar wire was the standard for wiring transmitters as well as receivers.)/

5. Don't use a constant current to heat the filament, use a constant voltage.
/(Constant current would be easier on the tube when 1st applying power to a cold filament when the resistance is very low. The author may have other reasons, though, that I'm not seeing.)/

6. Don't fail to use alternating current for heating the filament where this is possible.
/(Any receiver or amplifier will always have less hum with DC on the filaments. This was listed as a "receiving don't," but the same applies to vacuum tube transmitters of the day, few as they may have been.)/

7. Don't use wire smaller than No. 14 for connecting up the various parts.
/(Also a "receiving don't." Gross overkill, and this practice wasn't found necessary later in the decade.)//

/
8. Don't try to assemble a set if you don't know the difference between a binding post and a blue print. Buy a set ready to use. /(If you follow his advice you'll never learn the difference between a binding post and a blue print!)/

9. Don't try to operate your spark coil with 110-volt alternating lighting current without connecting in an electrolytic interrupter. Don't try to operate an alternating current power transformer with 110-volt direct current without connecting in an electrolytic interrupter. /(I don't know what he means by an "electrolytic interrupter," but these two appear contradictory. From the first "don't" you might think an electrolytic interrupter is a "slop jar" rectifier, but that makes no sense in the context of the second "don't.)/

Might have been a legal restriction.

Well this certainly is the case for litz wire. Also, the RF currents treat
the oxidized part of the wire just like an insulator. RF currents would
travel on the surface just under the oxidation. Stranded wire has more
surface area per unit diameter, and as you probably know RF currents have a
"skin" effect where the current only travels very close to the surface.
That is why litz wire is better for RF -- just way more expensive.

Yea, probably some early 20th century snake oil. I believe these debates
still rage for antenna wire.

I had the same thought. I bring mine up slow and find the sweet spot, so
long as I don't go above the filaments rated voltage.

As per some of the other don'ts here I believe this was just to save
battery life. You wouldn't need a low tension accumulator for your set.
This is only possible with indirectly heated cathodes.

Agreed. Tho I think this is the way they liked to build sets back in the
day with heavy wire all bent at right angles.

I think he screwed up here. An electrolytic interrupter is a meant to convert 110V DC (which was common in the early 1900's see the wiki article war of the currents) into pulsed DC. The current would flow between a sulfuric acid electrolyte with one carbon and one lead electrode. This would nearly instantly form a layer of gas bubbles around the electrode that would choke off the current. The bubbles would then clear and the whole process would repeat. Apparently you get a rather nasty 1000ish hertz pulse via this method. Unless it is a typo, I think the only reason you would need this for A.C. is if you were using a coil designed for DC with a built in interrupter that had been disengaged to use with A.C. Probably there might not be enough reactance at 60Hz on the primary windings. You would probably also more likely get an arc instead of a spark. The interrupter would make it more erratic, and possibly produce more blue snappy sparks instead of a white/peach colored arc.

I just bought a coherer on ebay. It is evacuated and contains both Nickel and Silver like the original Marconi coherers. I can't wait to show my students some marconi magic with an ignition coil, or spark igniter.

Very cool, Ron. Congrats on a very unique acquisition.

I wonder if you've investigated if and how they ran the UX-199 filaments from the AC line? Tungar rectifier maybe, but it would take a big capacitor to filter it. Perhaps what you thought was a spot for a C-battery is really for dry cells to light the UX-199s? It would be easier to design and build a AC line-powered C supply than a DC A supply in those days.

The UX-171, of course, could be lit by AC without a problem.

It is apparently not in Rider. The 56B1A and 56B1AU are in Beitman, vol. 16, p. 70, but they show as chassis HS-512 and HS-512A.

The 56B1 shows in the servicer folder of Sams set 455, and the 56B1A and 56B1AU in folder 9 of set 341. I do not have either set but if anyone on the list has set 455 perhaps they will have a look for you.

Hi John,

Tried that but something had to support the rubber. That something wouldn't stretch, Hi.

Started out for Raleigh this morning. Three hours later I was just barely at Fredericksburg and all I could see was brake lights ahead. Cancelled my motel reservations and came home. Last time I go to a Southern hamfest that cannot be easily reached by going another way.

73 and Happy Easter.

John

What caught my eye on that contraption is the Speaker.... Note that it is a Radio Magnavox HORN speaker driver where the voice coil is not attached to the typical horn diaphragm, the coil is pinned to the apex of a paper cone. It seems to be the earliest possible way a moving coil CONE speaker could have been made... Could be historic....

Just heard about RARSFEST tomorrow gonna try an be there if I can get my head turned off for a while.

Yup - it's in the 455 Servicer, all right. Typical late "three-power" portable with 1R5-1U4-1U5-3V4 layout, Couplate between audio stages, and senilium rectifier. It's packed for tomorrow's mail.

Stand by to upgrade the rectifier with silicon!

Ludwell Sibley

A big thank you to the AWA Convention group for getting the information out EARLY!

It is very complete and well done. Now we all can make our plans.

THANKS!

This has been noted elsewhere, but – here's maybe a more complete rendition. ELECTRONICS magazine for Sept. 1, 1957 reports a radio-controlled Japanese toy vehicles which used a spark gap transmitter and a simple coherer receiver. The very simple schematics are included with the paragraph. Apparently no direction-escapement switch was used in the receiver; only start-stop. It says the toy was approved by Japan radio regulatory authority. Kind of odd, no? for 1957. Even at this time, you'd think a transistor transmitter and receiver would have been practical for very short range use.

Oh yes – interesting point: transmitter is 4.5 volt operated, with an auto-transformer – buzzer arrangement. Receiver uses 1.5 volt bias on the coherer, operating into a relay for the vehicle motor. (Why not a 2-transistor receiver operating a relay? Maybe transistors were still too expensive?)

I don't think this magazine is up at americanradiohistory.com yet. If not, I plan to donate this copy, plus others – IF I ever get an email reply from the website owner.

The ELECTRONICS article cited the operating frequency as 150 kHz thru 180 MHz.
I would guess, more like DC thru something less than 100 MHz.

However, this toy was produced in 1957.
Someone on the AWA group reported the range as 10 feet. (~ 3 meters !).
Since there were already little “wireless broadcaster” circuits published at this date, also 2-transistor direct coupled radio circuits, it would seem possible. However, as you say, to produce a low-cost toy, price might have been prohibitive. For a higher priced expensive toy, I think, definitely possible.
Hmmm....interesting topic. I wonder when the first USA radio controlled toys appeared?

At this date, radio-controlled model hobbyists were all using tube transmitters and tube + transistor receivers. But this was for longer range, maybe out to 1000 ft (300 meters) or so.
I have seen German toys from this time that were controlled by a control-wire to the handheld
control unit.
I always thought coherers were more difficult to keep in adjustment, for sensitivity, but apparently I was wrong, for the owner of the toy could not be expected to do any adjustments
like that.

Around 1980, when I was working in downtown Seattle, I found a little junqtique shop down near the old train station / Chinatown. It was full of transistor radios, any one for $1.00 -
I bought a Regency TR-1, because even then, I knew it was worth owning. I found it worked perfectly.

Subject: Re: [Glowbugs] Coherer

Hello Hue,
the first commercial transistor radio the Regency TR-1 was offered in November 1954 at $49.95 which is equivalent to about $400 today.
It used 4 transistors made by Texas Instruments.
RF performance of early transistors was very bad and progress was slow. I doubt that a toy transmitter and receiver using transistors could be made in 1957 at any reasonable price.
Also remember that transistor stages back then were transformer coupled. I still have a few interstage coupling transformers somewhere. RC coupling was a later development.

Hue,

That is a very generous offer. I am glad that my idea of making all these
magazines available online is of benefit.

And yes, you read correctly... I did not want to try to build out the new
titles right now due to the cost of buying issues on eBay. But having a
quantitity of them to start a collection is very welcome. Any missing ones
can be picked up later as I see reasonably priced ones in eBay.

David

I have many copies of 'Computers and Electronics' and 'Poptronics'.
As you probably know, storage of paper is one thing; then being able to
access articles is another. So having anything online, despite some loss of
resolution on photos, is a plus.

The magazines I offer, UNLESS I specifically make a rare exception, will
arrive to you with no request for return.

There will always be no need to acknowledge receiving them and no need to
recompense for the mags or for postage.

This applies to the two mags I named above. No cost to you.

(If I read you right, you didn't want to get involved in buying these up at
this point.) -Hue MIller

Yes, Radio Electronics is one I want to complete all the way to the end of the run.

I have been considering adding Computers & Electronics, but I pushed it back, time-wise, as I have pretty much blown my cash budget for a while on "Billboard". I do want to add it, but don't want to spend much money. Same on Poptronics.

I forgot to mention, I think, that if the postage or shipping is too much on this, I can reimburse you via PayPal.. I do that with the majority of contributions to the site and that's not a budget-buster item.

Question:

Radio-Electronics, past 1992 to end of run, may I assume you want these to the end of their run?

Popular Electronics - despite the fact this is recent history, I can't quite sort out when it was "Computers and Electronics"
and when "Poptronics" - maybe later, the latter?

I think you probably do not want the "Computers and Electronics".
What about "Poptronics" ?

From: Gary H. Harmon, Jr.
Topic: 13719 Message: 13719

I have a Westinghouse WR-675 in the middle of restoration. I find no chassis number. There are two numbers on the inside paper labels; 26005 and 27624-13 but they may not be related to the chassis numbers.

1. Several days ago the dial cord broke. I've looked for a diagram to restring but with no success.

2. The two paper labels inside the cabinet are present but are in fair shape and hanging by a thread. What is the appropriate thing to do with them?

Any help or direction much appreciated.

The most recent AWA West Coast event was the 1975 meeting, joint with the Calif. Hist. Radio Society, at the then-museum at Foothill College in Los Altos Hills.

AWA policy beginning a couple of years ago was to no longer hold "joint" events with the, er, lesser clubs, evidently for liability reasons. That's why they're no longer called "joint" in the "Journal."

Membership is widely distributed: bicoastal plus substantial numbers in the Southeast and Midwest.

I need to restring a dial on a Westinghouse "picnic" radio. I haven't found any illustrations for the process. I understand the basic process that the spring should be pulled in place before the loose end is tied so tension is maintained on the cord. Is this final hog tying done with the capacitor meshed or open? I suspect three turns around the tuning control?

Thanks.

13728. Early Telegraph Sounder Recording

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2015-04-13 21:56:23 UTC
From: Charles Bliley
Topic: 13728 Message: 13728

Greetings Telegraphy Enthusiasts:

My daughter is a middle school teacher who is reviewing a book the kids read on a young girl stranded in a lighthouse on a island near Vancouver, Canada during a bad storm in 1900s. She needs help for the shipwreck at the foot of the lighthouse and tries the telegraph line to the mainland.

My daughter asked me if I had an old piece of telegraphy equipment to take into class, and if possible one that worked like she had when she was in middle school and contemplating becoming a radio amateur like Dad.

I told her I had a working practice key with sounder she could borrow. I checked it out and wired up a flashlight battery; it works just fine. Not bad for a 75, or more, year-old device as simple as it is. :-)

Now, I would like to give her an audio recording of what a real telegraph sounder relay message sounds like for her to add some color to her presentation. My Morse code is a rather rusty (SSB/FM guy) and my attempts to find any audio recordings on the Web of anything have only turned up CW samples. Not suitable at all.

Do any of you know of a source for 10 to 20 seconds of a code message that she could play on her iPhone? An MP3 would be best, but I could convert anything you have to that from most any audio file format.

Thank you for your help. :-)

From: Charles Bliley
Topic: 13731 Message: 13731

Thank you Chip for the recording. It fits the bill very nicely. :-)

The content is not important, but the transcription from Gettysburg may lead to other discussions in her class.

I looked at YouTube videos and although there were several samples, capturing the audio to a new file is a bit of a challenge for me. Besides, your message is longer and has its own unique meaning.

I need nothing further. Thank you again for the supportive and historical sample. :-)

73,

Chuck

Chuck,

You may have had a response from a number of folks, as K2TQN posted your
message to the Morsecode list. I am a member of the Morse Telegraph

Club, a group of landline telegraphy enthusiasts (and International Code as
well). We have a few e-mail lists as well as many active operators using
historic instruments on the internet with a program called MorseKOB. This
allows us to use the internet as a wire to simulate the actual telegraph
operation as practiced in the days of old.

We can certainly supply audio
and/or video snippets to use or, if you'd
like to supply some text, can

convert that to an audio file with
authentic American Morse.

You can search
out YouTube for the Morse Telegraph Club to see/hear some
of the demos put on
at Dayton by a few of our members.

I have attached a short audio file from
our Civil War News Feed
announcing the Battle of Gettysburg. The text
is:
WASHINGTON, JULY 1.
A BATTLE HAS COMMENCED TODAY AT GETTYSBURGH,
PENNSYLVANIA. THE FIRST AND
ELEVENTH CORPS HAVE BEEN SIGNIFICANTLY ENGAGED.
GEN. REYNOLDS HAS BEEN
KILLED. THERE ARE LARGE LOSSES ON BOTH SIDES. A
BRILLIANT FIGHT OCCURRED AT
CARLISLE BETWEEN THE REBEL CAVALRY AND ARTILLERY OF
GEN. FITZHUGH LEE, AND
OUR FORCES UNDER THE COMMAND OF GEN. W. F.
SMITH.

Please feel free to contact me with any questions. Jim Wades, MTC

President, may also have some suggestions as to where you could find
other
Morse audio files. We may even have members in you or your
daughter's area
that would be glad to give a live demonstration for her
class.

The MTC web
site is www.morsetelegraphclub.org and the MorseKOB web site
is
www.morsekob.org.

Hi Chuck,

One of the Morse Group guys said to go here...

http://kob.sdf.org/morsekob/

I took several Telegraph pieces into my middle school computer lab, set up a circuit in the rear of the room. (I was always taking in interesting things for the kids.) Well they loved it and tried to send their names, which I would try to guess. They experienced texting from the 1800's.

Your daughter's class will love it.

BTW=Edison was a telegrapher as a youth, before an inventor. Another tangent they can study which touches almost everything today.
BTW2= his biggest money maker was not the light bulb, but was the storage battery, invented for electric cars, and used for power for motor cars and their starters. And today, cars and batterys = electric cars.

Subject: [AWA] Early Telegraph Sounder Recording

Greetings Telegraphy Enthusiasts:

My daughter is a middle school teacher who is reviewing a book the kids read on a young girl stranded in a lighthouse on a island near Vancouver, Canada during a bad storm in 1900s. She needs help for the shipwreck at the foot of the lighthouse and tries the telegraph line to the mainland.

My daughter asked me if I had an old piece of telegraphy equipment to take into class, and if possible one that worked like she had when she was in middle school and contemplating becoming a radio amateur like Dad.

I told her I had a working practice key with sounder she could borrow. I checked it out and wired up a flashlight battery; it works just fine. Not bad for a 75, or more, year-old device as simple as it is. :-)

Now, I would like to give her an audio recording of what a real telegraph sounder relay message sounds like for her to add some color to her presentation. My Morse code is a

rather rusty (SSB/FM guy) and my attempts to find any audio recordings on the Web of anything have only turned up CW samples. Not suitable at all.

Do any of you know of a source for 10 to 20 seconds of a code message that she could play on her iPhone? An MP3 would be best, but I could convert anything you have to that from most any audio file format.

Thank you for your help. :-)

John,

Interesting. I thought the Edison cell was a dead end. There are current nickel iron cells being manufactured, I found out. It seems like some early battery type vacuum tubes had 1.2 volt filaments.

Thanks,
Barry

Topic: 13728 Message: 13734

Thank you all for your comments and references. :-)

Here are my comments on several writer's communications:

<< Here's a good one-- (both a box relay, then a sounder)
https://www.youtube.com/watch?v=-St7jTk5ciw

Tom
French >>

Nice video. I saw this one and while it was great from thevisual and audio point of view, I was trying to only capture some audio as I wassupplying her with the practice set that works.

<< Could you just record your sounder in operation andplay it on the I Phone?
73, Pete, N9SFX>>

Yes I could, but as I said, my CW skills are pretty poor andI was afraid the timing would not be genuine.

Chip Morgan, N3IW, sent me a sounder recording of a messagesent to Lincoln regarding the beginning of the battle of Gettysburg. It is agood recording and the subject matter could be a springboard to the use of thetelegraph during the Civil War.

<< Attached PDF on Edison by my grandson for his 4thgrade advanced science class. Yourdaughter's class might like to read it.

A good point to make: being a Telegrapher was the best job ayoung person (age 12/14 to 18) could get in those days. Many early Telegrapherswent on to become early Wireless operators, another good paying job. Many Wireless operators went on thebecome the founders of the radio industry who eventually developed CellPhones. Today we "text"one letter at a time with our Cell Phones in a manner similar to which theTelegraphers did. (what goes around....)

73, John Dilks, K2TQN >>

John made some good points about young people's interest in telegraphyin the 19th and early 20th Centuries. I will pass on theEdison story his grandson wrote to my daughter, but since this is an English studies class and nota history or social studies one, the article is a bit long to read aloud. I will let her be thefinal judge.

Several of you asked about the book, "Graveyard of the Sea. (DisasterStrikes, # 4).

I embedded link in my previousmessage to a description of the book. Perhaps, it was not active so here it is again.

http://umanitoba.ca/cm/vol16/no4/graveyardofthesea.html

The description of the book says it is based on realincidents in the Vancouver area. It is a children’s novel and not a historical account.

John’s newsletter is also filled with other interestingarticles besides the comprehensive on his grandson wrote. I hope I get back to it. Right now, we are having new carpeting putin one-half of the house and it will take us--mostly me--two days to pack up andmove everything from three rooms to safety. My wife purchases things like thiswith little regard to the support and disruption it will cause. No matter, Istill love her, but she will have to help me apply some Aspercream on my back later. ;-)

Thank you all for your support and interest. :-)

73,

Chuck

The cartridges from sound powered telephones are very sensitive. One would have to craft their own structure to get them over the head. FWIK these are recent and would use new magnetic materials. What is helpful to sensitivity is the strength of the magnet and how the mechanical connection is made to the diaphragm and the higher impedance the better.

Not all Baldwins have mica diaphragms, not all Baldwins are as sensitive as others. I have several pair and the most sensitive are a set that has been badly battered, chunks missing from the housings and a recovered headband. The old braided cotton band rotted away. I had a leather worker glue thin leather with Barge cement to sandwich the spring wire. The early ones also used metal called German silver to fabricate the yokes that support the cans. Polishes nicely.

If I were to shop at a meet for Baldies I would bring a tone source and an attenuator to determine the most sensitive. One must be able to uncap the can as well. Particles get caught in between the lever arm an restrict the sound output.

Reproduction green cords are available, often the OEM cords are tattered or are leaking, the only insulation is cotton, if the cord has become damp the copper tinsel corrodes and makes a conductive pathes.

The most sensitive headphones that I have ever run across is the Western Electric 509W, they run rings around the Baldwins that I have. I hear stations with the WE that I can't hear on any of my many other head sets. All 2000Z phones are not the same.

13750. K2AH Historic Transmitter - 1952

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2015-04-23 22:00:54 UTC
From: kawill70@...
Topic: 13750 Message: 13750

The March issue of QST included a reprint of a 1953 article by George Rose K2AH. The title was "The Transistor - Or 25 Miles on a Hunk of Germanium". A transmitter was built and contacts were made on 146 Mhz with several amateurs up to 25 miles away. The output power may have been as low as 30-50 microwatts. The link below provides a photo and schematic of the transmitter which is now at the AWA Museum.

https://sites.google.com/site/transistorhistory/Home/us-semiconductor-manufacturers/rca-history/first-2-metre-ham-transmission https://sites.google.com/site/transistorhistory/Home/us-semiconductor-manufacturers/rca-history/first-2-metre-ham-transmission

The transmitter used a Point-Contact transistor which is quite a bit different from the more familiar junction transistor. The original article stated that "in principle the circuit is a relative of the well-known Colpitts".

Can anyone explain how the circuit might relate to a Colpitts oscillator? I wonder if component placement could have provided feedback. Point-Contact transistors do exhibit negative resistance depending on the bias voltage.

There are other interesting questions. With a power input of 30 milliwatts, would the output power be as low as 30-50 microwatts? One also wonders how the circuit was able to operate on the 9th overtone of a 16.222 Mhz crystal.

It is surprising that transistors were available in 1952 that worked at 146 Mhz. George Rose was head of the Advanced Development Group at RCA and had access to specially made Point-Contact transistors that did work in the 100-300 Mhz range.

Thanks for any information.

Rose's story also appeared in the "World Above 50 M. C." column in "QST" for Jan. and Feb. 1953. He and the rig are on the front cover of the Feb. issue.

There was a sort of invisible arms race between the RCA types and hams at Bell Labs. T. W. Winternitz, W2YTH, wrote a Bell Labs internal memo in May, 1953 recounting early adventures by himself and others using nominally "reject" point-contact transistors: an R-C audio oscillator, a 40-meter xmtr, xtal oscillators for use up to the 4th overtone, NBFM and AM xmtrs for 10 meters, a 6-meter NBFM xmtr, a superregenerative VHF receiver, a regen broadcast radio; and various QSOs. The memo was printed in "Tube Collector" for Aug. 2009.

Point-contact transistors were no great model of linearity or quietness, but their HF performance was much better than with early junction units.

Thanks for the reply and comments. It's quite interesting to learn about the capabilities of the Point-Contact transistors available in 1952.

I recently found the Radio & Television News articles from 1952 referenced in the 1953 QST article. See the September, October, and November articles by Bob Slade entitled "Survey of Transistor Development".

My understanding is that Bob Slade made the experimental Point-Contact transistor used by George Rose in the 146 Mhz transmitter. The October article includes Point-Contact transistor curves including information on the Negative Resistance characteristics. The November article mentioned that one experimental transistor worked above 300 Mhz.

I found them on this site:
http://oldheadphones.com/crystal/phones/phones.htm

They weren't cheap. $69, but they look brand new. My antenna was down in a windstorm yesterday. After I got it back up in the evening, the headphones roared with a simple crystal radio circuit and a half sized G5RV. I have never heard that kind of volume from a xtal radio before.

Larry, I've picked up mine, (3) over time off of e-bay. They can run from low to high $. Any thing from $10 on up. And keep an eye out at the ham fest also.

I found them on this site:
http://oldheadphones.com/crystal/phones/phones.htm

They weren't cheap. $69, but they look brand new. My antenna was down in a windstorm yesterday. After I got it back up in the evening, the headphones roared with a simple crystal radio circuit and a half sized G5RV. I have never heard that kind of volume from a xtal radio before.

Regards,

Chris Maness

Yes, it is wired in parallel. So 6.3vac is enough for the tube to function?

I guess the Mullard tube in there is still like new then. I should sell to some audiophile, and buy some more ham gear. :D

Robert, think of the 12AX7 heater as two 6.3V heaters connected in series (which, in fact, is what it is). Since the junction of the two heaters us pinned out (pin 9), the two heaters can be connected in parallel for 6.3V operation, or series for 12.6V operation. Most, if not all, of the "12V" dual-triodes share this feature.

From Wikipedia entry for 12AX7:
The initial "12" in the designator implies a 12-volt heater requirement; however, the tube has a center-tapped heater so it can be used in either 6.3V or 12.6V heater circuits. -- PE Farley

We need Wikipedia to tell us how to wire the heater on a 12AX7?? I thought this was a settled matter.

Lest there be any doubt, the 1956 Heathkit catalog shows a circuit diagram for the QF-1, shows the heaters wired in parallel, and says the thing needs 6.3 volts. However, back in high school, I wired the heaters in a QF-1 in series, connected it to the 12-volt heater line in a Heathkit AR-2, and - by gum - it worked fine.

Will a 7AU7 run on 3-1/2 volts? Will a 3V4 run on 1-1/5 volts? Does the sun rise in the east?

Subject: Re: [AWA] Heathkit QF-1

From Wikipedia entry for 12AX7:

The initial "12" in the designator implies a 12-volt heater requirement; however, the tube has a center-tapped heater so it can be used in either 6.3V or 12.6V heater circuits.

[antiquewirelessassociation] wrote:

I read in the winter 2015 Journal in the 'Summary of Minutes' on page 8,
that the
AWA collection "cannot continue to grow at it's present rate. Non-essential
and
redundant items must be culled. Duplicate items are being sold on eBay and
an
auction is also being considered, in addition to the convention auction."

This brings up a couple of questions:
1. Why not list some of these items so that those of us not close to the HQ
shack
can have a chance at some of these surplus items. There oughta be a way
that

we could participate in the purchase of these items. Seems to me that
the auctions

are benefiting those that are fortunate to be close to the site and
those of us in the
boonies may be missing out on some nice parts, etc.
2. Also, does anyone know what th e eBay ID is for the AWA. I would like to
take
a look at what is being sold and maybe make some bids.

Thanks,
73 de Bill K4JYS

From: w0eom@...
Topic: 13786 Message: 13786

Last week i acquired a pocket crystal set made by Western Mfg. Co. of Kearney, NE.
When i started collecting in NE in the 70's, I learned of these sets, but never found one. They were made for almost 50 years under the name of ;Midway Radio, sold by mail, with ads in Popular Science and similar magazines. Crystal Clear has lots of info.

Years later, in CA, I met an engiineer at TRW who grew up in Kearney, and what's more, was the son of the founder. He said they still had all their production equip. and his brother was working on an auction. My next trip to NE to see my parents, i drove out to Kearney and visited with him. They had no crystal sets left, but i did leave with one of their early crystal detectors.

Now to find one of the early sets in a cardboard box.

Yes, this actually makes more sense to me. The yellow would be Cadmium Sulfide. The silver contacts in the wafer switch were as black as I had ever seen (Silver Sulfide). So it was in a Sulfur rich environment. Maybe next to an oil refinery or something. I did not know that Cadmium was/is used to plate screws.

Thanks,
Chris Maness

FYI,
Someone maybe interested in this.

My wife and I were in PA last week. We were driving from Galeton to Gaines heading to Wellsboro PA on route 6. We stopped at a country store that sells fishing equipment. It use to only sell antiques. There is barn attached to the back of the store and there was an metal case Atwater Kent table radio model 55 with a matching speaker. All the tubes are there and they are blue except for one. I thought the name of the place was the Barn but I can't find it on the internet. So I don't know for sure. They have a price of $250 but I think they would take a lot less then that. The store is on the south side of the road has a number of small building and tents next to it for people to sell antiques and crafts.

Tom

13797. SW3 Troubleshooting

Well, one possible issue. The audio amplifier tubes are not electrically equivalent. The 58 and 6D6 is, but the 227 and 76 are not. 900 and 1500 mmhos respectively at the same plate voltage. This might explain the feedback.

Regards,
Chris Maness

Chris, I don't think it's likely that the problem is due to the 76 in the audio amplifier stage. Later models of the SW-3 used higher Gm tubes in the audio stage.

One thing I've noticed with my SW-3 is that the connections to the coils need to be very good. If you haven't already, clean the coil pins as well as the socket contacts, and where the variable condenser rotors make their electrical contacts with the circuit, with a bit of Deoxit or equivalent contact cleaner.

You also may want to try swapping the 6D6s between the RF amplifier and detector sockets. I don't have the circuit in front of me, but see if there's any RC networks that decouple the B+ from the RF, detector and audio stages. If so, check the decoupling capacitors by temporarily bridging known good new components across them.

73/GL,
-Larry/NE1S

13800. Odd English in Electrical Experimenter, 1917

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2015-05-25 01:57:13 UTC
From: Hue Miller
Topic: 13800 Message: 13800

Still triaging magazines, I came across some 1917 copies of Electrical Experimenter.
Surprisingly, they are almost like just off the newstand condition, and at nearly 100
years old. Anyway looking thru one, I encountered some odd spelling. Like this,
discussing an electric motor:
"This is accomplisht by the manner in which the coils are connected to the fixt
commutator....
....a copy of the January issue in which these advertisements were publisht again.."

I know this is kind of an esoteric subject, but -- anyone know why this spelling
was adopted? Was this only a short-lived experiment by this magazine?
thanks-
Hue Miller
(this magazine is online at americanradiohistory. I did find I have a Feb. 1917
copy, which they lack, and which I will donate to them.)

Sounds like the editor was a fan of the Simplified Spelling Board,
funded in 1906 by Andrew Carnegie (who also provided the cash for over
3000 free libraries, many still in operation here and around the
English-speaking world):

http://en.wikipedia.org/wiki/Simplified_Spelling_Board

Some of the proposed reforms caught on; changing "ished" to "isht"
didn't last, while other variations had already been widely adopted in
the USA and remain in use today.

"The board's initial list of 300 words was published on April 1, 1906.
Much of the list included words ending with -ed changed to end -t
("addressed", "caressed", "missed", "possessed" and "wished", becoming
"addresst", "carest", "mist", "possest" and "wisht", respectively).
Other changes included removal of silent letters ("catalogue" to
"catalog"), changing -re endings to -er ("calibre" and "sabre" to
"caliber" and "saber"), changing "ough" to "o" to represent the long
vowel sound in the new words altho, tho and thoro, and changes to
represent the "z" sound with that letter, where "s" had been used
("brasen" and "surprise" becoming "brazen" and "surprize")."

I would like to get opinion on the European organization "Radio Museum" from any member of that group. It looks to me that they may have something of a “publish or perish” program: either submit material, or pay. Plus they have a $25 entry fee. Also I wonder: I do have original schematics I would donate. But I wonder if they would be scanned at a high enough resolution that small dense schematics and photos or drawings of parts layouts would be usable. In sum, are the benefits such that it’s worth the fees, keeping yet another password, or are their offerings essentially all available with other online groups?
thanks-
Hubert Miller

From: Hue Miller
Topic: 13803 Message: 13803

I would like to have some opinion on best tube data site and best
transformer data site
(if there is such a thing as "best".)
I am thinking of donating tube manuals and transformer catalogs.
It would be nice to see transformer catalogs scanned with OCR rather than
just an image
to peruse.
Or, maybe I need to do this myself. Oh no, not another project.

If you go to antiqueradios.com and search, you will find more "discussion" on Radio Museum (including many from the owner of that site) than you will care to read.

The "big time" in tube-data sites is Frank Philipse's massive site

www.tubedata.org/

He has data from "everywhere." It got him the TCA Stokes Award a few years ago.

13806. Wanted - KN4R

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2015-05-25 23:03:57 UTC
From: Brian Harrison
Topic: 13806 Message: 13806

Hello AWA,

Happy Memorial Day to all

I’m new to this list so I thought I would throw out a list of "wanted” items.

I’m looking for:

HRO Jr coils - these have a single coil chart window (not two) centered on the front of the coil and may be marked JA-JB-JC-JD
Any HRO-like receiver made outside the USA with a National PW main tuning dial on it - Kingsley AR7, Korting KST (German), AQST (German) etc.
Information on a National LSR Intermediate Frequency Receiver made for U.S. Lighthouse Service, Airways Division dated 7/31 (Order No 42435)
Any German or Japanese military radio
PS for Navy RBA RBB RBC
Coast Guard radio
Military direction finding equipment
Equipment used by the FCC or one of its sections - RID (Radio Intelligence Division), FBIS (Foreign Broadcast Information Service), etc.
Radio equipment used by any civilian airline any era
Interesting radios with a story behind them

I have a number of nice radios for possible trade. Please feel free to send me your want list so I can watch for the items you are looking for.

Tnx and all the best,

brian

Brian,

I am not aware of a National LSR receiver. National built two different receivers for government service that covered the intermediate frequencies. National designated the first as the 58C. It was basically an SW58 modified for rack mounting and front panel coil access. I am not sure of its government designation. I suspect it to be something like RIx. I think the R was for receiver, the I for intermediate and the last letter designates the model of the receiver. This was of course a regenerative setup. The second receiver by National for this use was designated as AGL by National and RIP for the government. This was a TRF receiver with two switched frequency bands. Both of these are rare, the AGL probably even more than the 58C. The 58C could be used with high frequency coils, the AGL only covered two bands below the broadcast band, not real useful.
I have a PDF file of the RIP/AGL manual. Bill W2DGB has one of each receiver.

73,
Barry

Brian,
I have a full pallet of RBB, RBC's, power supplies, and the unobtanium cables. I am at the point of downsizing. Due to the rarity of the power supplies (and doubly so for the cables!), I won't sell a PS or cable without the matching receiver. I will, however, gladly sell receivers without the cables or power supplies as I have about 4-5 extras. All of the receivers work, but may have minor issues like needing the pots cleaned. I'm amazed at how well the RBB's and RBC's have survived the years! You simply can't plug in most WWII stuff and have it still play....

Tom!?!?!? is that same ps as the rbm?
we need a LF companion at some point (has to be really nice
cosmetically) for the RBM we have here in the museum
it was actually my childhood shortwave recv!
Nice mentor of mine fixed me up with it but though the lf one would
be a 'waste of time' so i think he scrapped it... arghghghghgh
went back try to talk him out of it and he had rid him self of it.

Ed,
Nice story! I hate to see stuff go to the dump in general, but especially when someone else is willing to take a stab at saving it! I think it is the same supply... It's the 21030. I have Serial Number 3 here... I bet it could tell stories if it could talk! I partially restored one of the power supplies: The inductors leak PCB's, and rust... I had to do a deep cleaning, get rid of the rust, seal and respray the inductor.

That reminds me: I have somewhere a schematic of the SW-3 modified by Alaska Steamship Co.
for ship use, on the MF band only. Apparently the HF work was taken care of by the Sargent 11
receiver. The mod only changed the coils, I think. I'll describe it, if anyone is interested, when
I find that schematic again.
Some work logs I found seem to indicate the SW-3 replaced the IP-501s at the start of WW2 -
perhaps because of the submarine scare.

The RBM is certainly a nice looking instrument and Sam paid a lot of money for it, too:
about $1000 in WW2. The HF one doesn't make a swell SWL receiver, tho: the tuning
rate is way too fast on the high band, and the selectivity control is more like
"WIDE - WIDEST" . I have the MF one and that one I think is nice for MW BC DXing.
The electrical design of both is pretty nice, 4 gang tuning cap and not one of those
pentagrid mixers. Wish they'd provided a little slower tuning gearing on the HF
receiver tho.
Ebay a few years back had a pair that had been military reworked to be rack panel
mounted, whole new front panel. Odd. I think some military overhaul shops didn't
exactly have a crushing workload and were happy to take on any project regardless of
its actual cost or merit.

I have a modified SW3, it has a B+ switch, and on the back is mounted an audio transformer to take B+ off the audio output. It has multiple 1/4" phone jacks as well as a phenolic board with several connectors. Wiring is neatly laced and appears professional.

Any ideas?

have bc 640 and bc 639 int there too
have spark biplane transmitter and field ww1 crystal set..

have exciter like in the HF radio in the titan missile silo here in az..

have racks of Command sets , have radio direction finders , and
got the liaison transmitter before the art 13 along with a bc348 to
keep it company.

and more and more and more......

Yaesu FTDX-9000
It comes with the manuals and original shipping boxes.
Very clean rig with no issues, includes manual, keypad, keyboard, and hand microphone.
I have the original shipping box.
Price: $5800.

Icom IC-7800 w/SP-20 Speaker
Icom IC-7800 Rev. 2 with 15, 6 and 3 kHz Roofingfilters and the latest 3.10 firmware installed.
Included is the matchingSP-20 Speaker.
Supplied accessories include printed Factory IC-7800 instruction manual &2013 color instruction manual complete with firmware updates, AC power cable, Antennajumper cables, Rack mounting handles & screws, Compact Flash memory card, 1-pairfront stands, and Main dial.
Radio will be shipped in the original factory double box with speaker packed..
Price: $4050

Icom IC-756 Pro3.
I have the manual, the schematics, a bag of fuses, the 1/4 inch CW plug, the power cable and the hand mic. Bagged in original bag, in the original foam, and in the original box.
I will include the SM-20 desk microphone and the SP-21 speaker.
Price: $1450

I am downsizing station.

Hi Hue! Bob my mentor back then taught me to use pencil eraser engaged with side of big knob as a gear reduction....

Ed#

it worked well to do that.. and was better than the firestone table radio that had a sw band...

In a message dated 5/25/2015 5:42:43 P.M. US Mountain Standard Time, antiquewirelessassociation@yahoogroups.com writes:

The RBM is certainly a nice looking instrument and Sam paid a lot of money for it, too:
about $1000 in WW2. The HF one doesn't make a swell SWL receiver, tho: the tuning
rate is way too fast on the high band, and the selectivity control is more like
"WIDE - WIDEST" . I have the MF one and that one I think is nice for MW BC DXing.
The electrical design of both is pretty nice, 4 gang tuning cap and not one
of those
pentagrid mixers. Wish they'd provided a little slower tuning gearing on the
HF
receiver tho.
Ebay a few years back had a pair that had been military reworked to be rack
panel
mounted, whole new front panel. Odd. I think some military overhaul shops didn't
exactly have a crushing workload and were happy to take on any project regardless of
its actual cost or merit.

I have made some progress. Been sick with a bad cold, but starting to feel better. I swapped the tubes and with my 40m band spread coils I am copying CQ CQ de W6GLP :D The controls are still very touchy and I wouldn't dare putting the headphones on yet. No smooth transition to detector oscillation. I just pops and farts, but now no squeal with the 40m coil. I have to floor the gain to get anything, and the RF stage tuning is incredibly sharp.

Pot R4 is bad. It was probably damaged during shipping just like the dial was. I have infinite resistance across the pot, and flakey connection on the wiper. That also seems to explain why it would just snap into regen. The track is probably cracked.

Regards,
Chris

Replaced the broken pot, and it works like a champ now. Much better tuning and stability than my first SW3. I would like to get the OEM variable cap for that one now. This old gal is actually very usable as a real ham radio. I now need a pre-war xmiter.

Glad you got it going, Chris. I have been playing with my SW-3 this afternoon and made 4 forty mtr contacts using it with a HB 6AG7 xmtr (1950). I hope to give it a try on 80m if the QRN ain't too bad. For 80m I can use a HB Jones P-P 6A6 which is from around 1935. The usual rcvr I use with that xmtr is a HB one tube regen, also from 1935, both in RADIO mag. I will also be looking for a more period correct xmtr to use with the SW-3, maybe something from around 1930-33. Keep us posted re the xmtr ckt you choose. Hope you continue having fun with your SW-3....73 de Bill K4JYS ----- Original Message ----- From: "Chris Maness chris@... I have been playing with my SW-3 this afternoon and made 4 forty mtr contacts using it with a HB 6AG7 xmtr (1950). I hope to give it a try on 80m if the QRN ain't too bad. For 80m I can use a HB Jones P-P 6A6 which is from around 1935. The usual rcvr I use with that xmtr is a HB one tube regen, also from 1935, both in RADIO mag. I will also be looking for a more period correct xmtr to use with the SW-3, maybe something from around 1930-33. Keep us posted re the xmtr ckt you choose. Hope you continue having fun with your SW-3....73 de Bill K4JYS From: "Chris Maness chris@chrismaness.com [antiquewirelessassociation]" To: antiquewirelessassociation@yahoogroups.com Sent: Saturday, May 30, 2015 4:53:11 PM Subject: [AWA] Re: SW3 Troubleshooting Replaced the broken pot, and it works like a champ now. Much better tuning and stability than my first SW3. I would like to get the OEM variable cap for that one now. This old gal is actually very usable as a real ham radio. I now need a pre-war xmiter. Chris On Wed, May 27, 2015 at 9:11 PM, Chris Maness wrote: Pot R4 is bad. It was probably damaged during shipping just like the dial was. I have infinite resistance across the pot, and flakey connection on the wiper. That also seems to explain why it would just snap into regen. The track is probably cracked. Regards, Chris On Wed, May 27, 2015 at 7:48 PM, Chris Maness wrote: I have made some progress. Been sick with a bad cold, but starting to feel better. I swapped the tubes and with my 40m band spread coils I am copying CQ CQ de W6GLP :D The controls are still very touchy and I wouldn't dare putting the headphones on yet. No smooth transition to detector oscillation. I just pops and farts, but now no squeal with the 40m coil. I have to floor the gain to get anything, and the RF stage tuning is incredibly sharp. Regards, Chris KQ6UP On Sun, May 24, 2015 at 6:28 PM, Chris Maness wrote: Because I only have a 6.3V doghouse. Chris On May 24, 2015 11:12 AM, wrote: Chris, Why do you want to convert to a 6.3V anyway? Serial # 3? amazing!

Ed#

In a message dated 5/25/2015 5:09:13 P.M. US Mountain Standard Time,
antiquewirelessassociation@yahoogroups.com writes:

Ed,

Nice story! I hate to see stuff go to the dump in general, but especially
when someone else is willing to take a stab at saving it!
I think it is the same supply... It's the 21030.
I have Serial Number 3 here... I bet it could tell stories if it could
talk!
I partially restored one of the power supplies: The inductors leak
PCB's, and rust... I had to do a deep cleaning, get rid of the rust, seal and
respray the inductor.
< br>
-Tom

Tom!?!?!? is that same ps as the rbm?
we need a LF companion at some point (has to be really nice
cosmetically) for the RBM we have here in the museum
it was actually my childhood shortwave recv!
Nice mentor of mine fixed me up with it but though the lf one would
be a 'waste of time' so i think he scrapped it... arghghghghgh
went back try to talk him out of it and he had rid him self of it.

Attachments: 1 described; binary payloads are missing from this source WARC

I am looking for ANY modern color photos of this early version of the Eveready #6 sized 1.5 Volt dry cells. (See attached).

The key thing is that this graphic shows radio towers which were eliminated in the 1925 copyright graphics.

Don’t be fooled by the white background used around the Eveready logo in this B&W image. They commissioned an artist to make images that would ‘pop’ in B&W gray scale or line art.

In the past year I have spent hundreds of hours on creating museum grade replicas of 20s vintage radio batteries and REALLY want to bring these apparently really rare Eveready cells back to life.

Thanks,
Robert

Dave, as a last resort, you might check with Gary at Play Things of Past. See his Knob page....http://www.oldradioparts.com/knobs.htm
You can email him and ask if he has one.

Also this guy on eBay sometimes has a lot of knobs...http://www.ebay.com/sch/olr8eo69/m.html?_trksid=p4340.l2562. Never done any business with him. Plus you may do a
general search of eBay for antique radio knobs or National SW-3 knobs, etc, may turn up something.

Re: Elenco "power gainer" compression amplifier

Wed Jul 1, 2015 10:17 am (PDT) . Posted by:

"Tom Lewis" n4tl2
Joe,
oops. You were asking about the Elenco "Power gainer", not the Trio "Signamax" Preselector.
If I find info on the Power Gainer I will let you know.

Subject: [AWA] Re: Elenco "power gainer" compression amplifier

Hello Tom N4TL, If you find out any information on the Elenco "Power gainer" amplifier please let me know. I have one too and need the hookup information for it. The reason why I have it is because it had a Elenco model 77 SSB transmitter attached to it less any cabling, etc. I need the hookup information for it so I can run oit with my Elenco transmitter when I get it going. Very best regards, Joe Cro N3IBX (n3ibx@...)

Looking for a knob for an SW-3

Wed Jul 1, 2015 8:48 am (PDT) . Posted by:

WA8DOF
Hi gang,

A local friend has an SW-3 Thrill Box that is missing one of the three round knobs. If anyone has one they can spare, he would like to purchase it.

Thanks

Dave

Dave, as a last resort, you might check with Gary at Play Things of Past. See his
Knob page....http://www.oldradioparts.com/knobs.htm
You can email him and ask if he has one.

Also this guy on eBay sometimes has a lot of
knobs...http://www.ebay.com/sch/olr8eo69/m.html?_trksid=p4340.l2562. Never done any
business with him. Plus you may do a
general search of eBay for antique radio knobs or National SW-3 knobs, etc, may turn
up something.

Also this guy on eBay sometimes has a lot of knobs...http://www.ebay.com/sch/olr8eo69/m.html?_trksid=p4340.l2562. Never done any business with him. Plus you may do a
general search of eBay for antique radio knobs or National SW-3 knobs, etc, may turn up something.

Subject: [AWA] Looking for a knob for an SW-3

Hi gang,

A local friend has an SW-3 Thrill Box that is missing one of the three round knobs. If anyone has one they can spare, he would like to purchase it.

Thanks

Dave

"Dave VanDenburg" WA8DOF
Hi Ernie
I should have attached a photo. Thanks for the reminder.
I am looking for the "tuning" knob, which has a larger shaft hole.

13873. "The Radio Manual", Sterling 1928 ?

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2015-07-05 00:04:27 UTC
From: Hue Miller
Topic: 13873 Message: 13873

So I bought this 1928 edition of “The Radio Manual” by Geo. Sterling. I bought it because while I have later editions, this one has more marine spark transmitters.
One thing puzzles me about the book I bought: on the title page, the page that bears the date, it has the title,
The Radio Manual [etc.]
by George Sterling
Radio Inspector, Radio Division, U.S. Department of Commerce

then right below this has been excised from the paper a rectangle about 1.5 inches wide, about 1/8 inch tall. Why would someone cut something out of this page? When I flip the page over, to its back, it does not look that there was any printing in the area where the cutout was made. An owner’s name IS written on the front and back inside covers.
Is there some text or what? that was cut out? Any ideas?
thanks-
Hue Miller (Newport, Oregon)

yes Hue, we too have all editions lotta neat stuff in them

I suspect the prior owner of this book may nave disliked that author? :-(
people were snarky and destructive even back in the old days!

our 3 edition here even has a DJ as do later last editions.

these are so interesting I keep a duplicate of several editions and
I like to flip though here at home too the master set is at the
museum. In addition some these other old time books had many editions
and the stuff would change so in the collection at museum we try to
have all.

someday these and everything else will be on the net... but I would
rater read paper than screen... now if I am esearching and keyword
searching.... I do appreciate the electronic copies!

From: Bill Stewart
Topic: 13879 Message: 13879

To those interested, it's Maritime Radio Historical Society Night of Nights time again. Newsletter 51 gives all the details. KPH, KFS, KSM, WLO & KLB will be active. May be the last time USCG stations will participate. K6KPH & W4WLO will be active. The coastal stations will operate on numerous old ship/shore CW channels including around 500kc . Also great info on antique receivers the MHRS has recently received:
RCA SSB R-3, IP-501A, RAZ-1, AR-8510.
The restoration of these receivers and other info makes very interesting reading.

MRHS Newsletter No. 50

Dedicated to True Believers Worldwide

Special Night of Nights Edition

4 July 2015

Newsletter back issues click HERE MRHS Web site click HERE

Basic Event Enformation: Date: 12 July 2015 Pacific Daylight Time

First Transmission form MRHS Stations: 5:01pm Pacific Daylight Time 12 July, 0001Z 13 July 2015

Full details below

> Historic coast stations KPH, KFS, KSM, WLO AND KLB will be on the air!

> USCG stations NMC, NMW and NMQ will return to the air - possibly for the last time!

> RCA "H Set" Transmitter 298 will be on the air (KSM 22Mc)

> 1942 Press Wireless PW15 transmitter will be on the air (KFS 12Mc)

> K6KPH will be listening for calls and signal reports

> W4WLO will be listening for calls and signal reports

> Hear about Night of Nights on KWMR

> Join us in person or on the air!

But wait, there's more:

> Attend a special presentation on the history of KPH

> Project to rebuild a RCA SSB R3 diversity receiver
> 1925 Radiomarine IP-501-A receiver obtained by MRHS - and more!

> Frank Geisel's Report No. 3 for June/July 1946

> Antenna Report

Clearly we have a lot to cover in this issue. But before we dive in we'd like to solicit your support for our activities like Night of Nights and the ongoing maintenance and repair of the transmit and receive stations and their associated antenna fields. As many True Believers know, we suffered significant damage to our antenna field in a December storm. This included the felling of a 100ft antenna pole which took out the MF antenna and three antennas (including the MF Marconi T).

Downed pole in Bolinas antenna field

Since then Roy Henrichs of the Transmitter and Operations Departments has done a thorough survey of every antenna at the transmit and receive site, so we know where we stand. The picture is daunting. Everything from the guy anchors to the poles themselves is in need of repair or replacement. But now we are ready to start reversing years of deferred maintenance. To do this we figure we'll just about deplete our bank account, money that's there only because True Believers have contributed very generously to the MRHS. Can you assist with a contribution? Any donation you can make will be very deeply appreciated and will go directly to support our efforts. Just click on the button below.

Thanks,

MRHS

Make a Donation

> Night of Nights 2015!

It's that time of year again. Time to honor all those ops who came before us by preserving their skills, traditions and culture through on the air operations.

Why 12 July? Long time True Believers know the story. But it may be worth repeating for new arrivals and to remind everyone of the traditions we hope to keep alive.

On 12 July 1999 some very tough looking grizzled old radio pioneers had tears in their eyes as the last commercial Morse code radiogram was sent. It was the end of an era. And as the last beeps faded away into the static they witnessed the end of the career to which they had devoted their lives.

Paul Zell sends the last commercial Morse messages at KFS/KPH - or so it was thought

These men - and some women - had stood watch over the airwaves on shore and at sea. Theirs was mostly the business of maritime commerce. But when their ship was in peril they were called upon to send the most electrifying three letters in radio, S O S , knowing that all

their fellow radio operators would press their earphones close to get every scrap of information and bring aid to their stricken ship.

Once, our coasts were dotted with great Morse code radio stations, all communicating with ships at sea. They're all gone now... all except one, the one they called the Wireless Giant of the Pacific, located at Point Reyes.

On that sad day in 1999 another event took place. The Maritime Radio Historical Society (MRHS) was formed. We made it our life's work to honor the men and women of wireless by restoring that wireless giant. One year and one minute later the giant's voice once again spanned the oceas as we picked up the thread and kept the faith with our colleagues of the air.

Every year since, in an event that became known as the Night of Nights, Morse code station KPH has returned to the air, joined by KFS and the station of the MRHS, KSM.

This year our friends and colleagues at USCG station NMC have labored mightily to bring that storied call sign back to life on Morse code for the evening along with NMQ in Cambria, CA..

And station NMW in Astoria, OR will be on the air as well.

Stations WLO and KLB will join us again as hey have in years past.

This is a global and local event. Hundreds of listeners around the world will be waiting with their earphones on, waiting for the signals of the great station to once again arc over the dome of the Earth to their receivers.

You can be with us in person!

Dozens of people will join us at the RCA receiving station in the Point Reyes National Seashore to watch as the signals are transmitted by hand using vintage telegraph keys.

A guest operating position will be available so bring your key and 'phones or use ours and operate K6KPH. No license required! So if you're an ex-commercial op who never became a ham here's your chance to sling some Morse again. Or if you hold a current commercial radiotelegraph ticket you can operate KPH, KFS and/or KSM and have your license endorse to that effect.

This year we will have our custom made endorsement stamp available to add that special touch to your ticket.

Chief Operator Richard Dillman at Position 1

Date: Friday 12 July 2015 Pacific Daylight Time

Location: RCA receiving station, 17400 Sir Francis Drake Blvd., Point Reyes National Seashore

Click HERE for a map of the location from Google Maps

Time: Doors open at 3:00pm pdt, first transmission 5:01pm pdt (0001gmt 13 July)

Refreshments: Served

Photographs: Encouraged

Tours: Given

None of this would have been possible without the trust and vision of the Point Reyes National Seashore . The only reason these facilities were spared the bulldozer that visited all the others is that they are on park land. And the only reason they have been restored to operation is that the PRNS staff understood their importance and trusted the MRHS to restore them to life.

MRHS Stations

Notice: At press time we have not received authorization to use the KPH and KFS frequencies. A special update will be sent when final information is received.

Sixteen transmitters will be on the air from the MRHS transmitter site in Bolinas. That doesn't include transmitters held in ready reserve in case of failure. Members of the crack MRHS Transmitter Department and the H Set Team will be on hand to assure that all goes well.

> KPH:

Frequency Transmitter Antenna

500/426 Henry MF-5000D Marconi T (Off the air, antenna down)

4247.0 RCA K Set Double Extended Zepp
6477.5 RCA K Set Double Extended Zepp

21050.0 Henry HF-5000D H over 2

> Reception Reports

Reception reports and verification requests for the MRHS stations listed above may be sent to:

Maritime Radio Historical Society
PO Box 392
Point Reyes Station, CA 94956
USA

> Station Telephone

The receive site may be contacted by phone on 415-669-9646

> Hear about Night of Nights on KWMR

Community radio station in Point Reyes Station will broadcast a special presentation about Night of Nights on the Epicenter program at 5:00pm Pacific time 8 July. Listen directly to KWMR on 90.5 Point Reyes, 89.9 Bolinas or 92.3 in the San Geronimo Valley. Not in the listening area? No problem. Listen on line via the KWMR Website . Just click on Click to Play. Can't listen at that time? Again, no problem. Listen to the KWMR archive of the program. Click on the date, 8 July, and the program name, Epicenter.

USCG Stations

NOTICE!

This may very well be the last time ever that USCG stations can be heard on the air using A1A (Morse) emission. As new equipment is installed the hardware and wiring for Morse has been progressively removed. And the personnel who knowledgeable in the art retire or are reassigned. So be sure to listen for these stations.

Many USCG personnel at all levels are responsible for bringing these stations back on the air for Night of Nights 2104. We want to particularly thank ET1 Mike Leska and Chief Eric Simmons (Ret.) for taking the lead for this year's project.

NMC/NMQ verification card from Night of Nights 2014

> NMC (Transmit Bolinas, Receive Pt. Reyes)

Frequency Transmitter Antenna

472.0 Nautel ND2500TT/6 173' monopole tower
500.0 Nautel ND2500TT/6 173' monopole tower
6383.0 Rockwell-Collins RT-2200 Omni-directional
8574.0 Rockwell-Collins RT-2200 Omni-directional
17220.5 Rockwell-Collins RT-2200 Omni-directional

NOTE regarding NMC/NMQ/NMW MF transmissions. Only one MF transmitter will be in service at each station. Morse transmissions will be made on an as-available basis from each station as USCG operators must also accommodate scheduled NAVTEX transmissions.

> NMQ (Transmit Cambria, CA, Receive and Control Pt. Reyes)

NMQ Transmitters

Frequency Transmitter Antenna

448.0 Nautel ND2500TT/6 Inverted L
500.0 Nautel ND2500TT/6 Inverted L

> NMW (Transmit Astoria, OR, Receive and Control Pt. Reyes)

Capacitive top hat transmitting antenna at NMW

Frequency Transmitter Antenna

448.0 Nautel ND2500TT/6 Capacitive top hat
500.0 Nautel ND2500TT/6 Capacitive top hat

> Reception Reports

Reception reports and verification requests for the USCG stations listed above may be sent to:

Attn: OSCS Phil Marsh
USCG CAMSPAC Point Reyes
17000 Sir Francis Drake Blvd.
Point Reyes Station, CA 94956
USA

Shipcom LLC Stations

All thanks to Rene at WLO and CJ at KLB for the work they do each year to bring these stations back on the air. They are true radiomen.

> WLO

2055.5
4343.0
8658.0
12992.0
16968.5

> KLB

488.0
500.0
8582.5

> Reception Reports

Via email (for both stations) to: wloradio@wloradio.com

> W4WLO

Here's great information just received from Rene Steigler of WLO:

We will activate W4WLO ON 40 and 20 meter CW for Night of Nights. We are thinking 7055/14055 so as not to interfere with K6KPH.

Be sure to listen for W4WLO and give them a buzz.

> Calling Channels

All commercial and USCG stations listed above will listen for calls from ships on 500kc and on ITU Channel 3 HF:

4184.0
6276.0
8368.0
12552.0
16736.0
22280.5

Listen on these frequencies if you want to copy both sides of ship to shore contacts.

> Commemorative Messages

Was your father, uncle or grand dad a commercial op or amateur operator? Would you like to send a commemorative message in their honor over KPH, KFS and KSM? We have sent several of these messages in past events and they were all very moving. If you would like us to send such a message this year please send it to us no later than Wednesday 9 July pdt so we can be sure to include it. Sent it to info@...

> Attend a special presentation on the history of KPH

The Novato, CA library has kindly invited Chief Operator Dillman to present his famous lecture and slide show on the history of wireless in West Marin at 6:00pm on 29 July. The presentation will cover in detail the span of this dramatic story from the establishment of the first Marconi stations at Bolinas and Marshall in 1914 including both trans-oceanic operations and the history of KPH.

Many photograph that have never before been seen in public will be shown. If the history of maritime communications is an interest of yours, this presentation is not to be missed. The Novato library can accommodate 60 people. There are still a few good seats left. So mark your calendar and join us at this event.

Date: 29 July 2015
Time: 6:00 pm
Location: Novato library, 1720 Novato Blvd, Novato CA 94947

Phone: +1 415-473-2050
Google Maps: Click HERE

> Project to rebuild a RCA SSB R3 diversity receiver!

This should probably be the headline story for this issue of the Newsletter. In fact if this wasn't the Night of Nights special issue, it would have been. Hold on to your earphones: the MRHS has plans to rebuild a RCA SSB R3 diversity receiver! This is real Jurassic Park stuff.

If that statement doesn't quite cause you to gasp in amazement then we refer you to information about the magnificent R3 in Newsletter No. 16 and Newsletter No. 19 . At the time this information was written the crack H Set Crew had completed three years of work to bring T3 transmitter 298 on line at Bolinas. The T3 is a four channel independent sideband transmitter used in trans-oceanic point to point service. But we never expected to have the companion R3 diversity receiver to show visitors. There once were dozens of these receivers in the receiving room upstairs at Point Reyes. But they had all gone to the dump, leaving us with just a few fragments.

Now comes a overseas seller with just about all the components needed to rebuild a R3! Needless to say we struck a deal for everything he had, figuring that True Believers would approve of this expenditure of the funds they had donated to the MRHS.

At press time the status is that everything is in a wooden crate undergoing customs inspection in New York. We have to wonder what they will make of this stuff! Once the crate is released by customs we assume it will be loaded on a truck for shipment to San Francisco.

We have to say that the business of international shipping is complex, with endless forms and the need for brokers and agents. Nevertheless, if this effort produces a complete and working R3 receiver that we can show folks when they visit, we think it will be worth it.

Where to put the receiver? Sadly, it can't go back into the receiving room at Point Reyes. That room is now Park Service offices. But! The receivers for the last point to point link were actually installed just outside the CW operations room while the receiving room was being torn apart of a satellite Earth station. So our plan is to install the completed receiver in that same space, completing the circle and returning a functioning R3 to the very spot where one of its magnificent brothers once stood.

Of course we will keep you posted on our progress.

> 1925 Radiomarine IP-501-A Receiver Obtained by MRHS

When we started the KPH restoration project back in 1999 one of the first things we did was to gather up all the historic photographs of the station and go over them carefully and repeatedly to extract and absorb all the important details they contained. One of our favorite photos is of the KPH receive position taken in 1920. The station had just moved to the original Marconi trans-oceanic receive site at Marshall. As always, the KPH operation had secondary status and the ops were relegated to a corner of the building, huddled over their receivers, their Western Electric 509 headphones clamped to their heads, their Underwood mills at the ready.

KPH ops on duty at Marshall

There are lots of details in the photo including the land line telegraph sounder to the left, chattering out messages from Bolinas and San Francisco in American Morse. Yep, the operators had to be bilingual in Morse. But if course it's the IP-501 receivers that draw the eye of the True Believer .

The IP-501, made primarily by Wireless Specialty Apparatus Co., was the standard commercial receiver of the day, used aboard ship and at coast stations like KPH and WUP of the US Army at Ft. Mills in the Philippine Islands (below) .

It used a single tube as the detector although provision was made for the use of an external crystal detector. Note the external two step audio amplifier connected to the right of each receiver in the KPH photo. This allowed excellent headphone volume as well as the ability to use a horn speaker.

For years we mooned over these receivers, hoping to add one to our collection. We wanted one for two reasons: for display to visitors and so we could experience what it was like to operate one of these receivers, so different from a modern receiver or even a 70 year old receiver from WWII.

We suppose there's something to the saying that all things come to those who wait because an IP-501-A receiver recently became available. The A model incorporates the two step audio amplifier in the receiver cabinet. The receiver on offer was expensive but in superb condition. Plus it was made by Radiomarine, thus providing direct lineage to RCA and KPH. So, after much discussion, we decided to make the purchase.

When the receiver arrived, MRHS members gathered with great reverence to observe its careful unpacking. It was everything we hoped it would be. Luckily, one of our number, Steve Sparks, has an IP-501. He is also a radio historian and a gifted radio diagnostician. He took charge of the slow and careful process of bringing the receiver to operational status.

One of the first orders of business, after checking the tubes (all RCA, by the way), was to select the correct grid leak resistor for stable operation.

That's when we discovered that, yes Virginia, there really *is* such a thing as a grid leak drip pan!

We don't know why but for some reason we found it astounding to see that a resistor manufacturer of the 1920s had enough of a sense of humor to produce these as promotional items. They must be rare as chicken lips. Anyway, we had never seen any before.

After the hilarity died down we returned to work. Life giving voltages were applied to the proper terminals. The tubes grew warm. The earphones came alive. The receiver was in great shape, requiring only a little tweaking (and a bit of a steep learning curve on our part). Then it came time to attach an antenna to see what we could hear. The tuning range of the receiver is 300 to 8000 meters (38kc to 1Mc). Our targets were the non-directional beacons at the local airports. We used a selective voltmeter to assure that signals could be heard on the hastily strung up wire antenna (the Marconi T antenna overloaded the receiver). Then we tuned for those signals on the IP-501-A.

Bob Dildine tunes the selective voltmeter while Steve Sparks manipulates the controls of the
IP-501-A.

It was old guys working with old radio gear at an old receive site on a foggy day at Point Reyes. How much better can it get? Well, we guess it got maybe even a little better when we placed the IP-501-A on a special table to had made just for it and placed the horn speaker on top. Not just any horn speaker, mind, but the exact same make and model horn speaker we see in photos of KPH at Marshall.

The IP-501-A on its custom made table, with horn speaker, in the main hall of the receive site at Point Reyes

Now, how about the reception of some signals in the MF marine band? Our plan is to tune the receiver to the KSM 426kc signal to demonstrate it to visitors. But alas, as noted above, our MF transmit antenna is on the ground. But! MRHS Transmitter Supervisor Steve Hawes is also a member of the radio department (in fact, he *is* the radio department) aboard SS RED OAK VICTORY/KYVM . The ship, with Steve at the key, was on the air on 6 June (D-Day) on MF and we copied his 500kc signals on the IP-501-A!

Here are some notes from Steve Sparks on the work we did on the receiver:

Before applying power to the receiver, we first checked audio transformers, fixed and variable condensers, and the grid leak. Everything was good except for one open solder joint. We installed tested tubes and were able to hear things. Operation of the controls was puzzling until we discovered that two knobs were installed 180 degrees out of correct alignment, making the primary circuit tuning knob tune backwards and reversing the sense of the coupling control. Excessive howling was greatly improved with the installation of a slightly lower value grid-leak resistor. Using a long feed line as an antenna seemed to be causing overload, so we put up a 100 foot wire and that worked better. Impulse noise was reduced with a common-mode power line filter on the power supply. With that final improvement, we were able to log four NDBs at mid-day, the farthest being FCH Fresno 344 kc, about two hundred miles away.
Steve

Partial view of the Treasure Room. Strict rule: no drooling.

The next step is for you to join us at the receive site some Saturday. Identify yourself as a True Believer for admission to our Treasure Room where the IP-501-A and many other items of interest reside.

> Another Receiver!

Another historic Radiomarine receiver has recently arrived. Actually there are three components involved: receiver CRM-46092, preselector AR-8503-P and power supply CRM-20096, known collectively by the military as RAZ-1.

This receiver is the direct descendant of the IP-501-A, replacing it in most shipboard installations. It covers 15kc to 600kc in four ranges. While it is clearly a more modern and easier to use receiver, it's amazing how many features and similarities it has with the IP-501-A. At this writing the components have been cleaned and inspected. Much to our relief all three units appear unmodified and in excellent condition. Like its IP-501-A older brother, The CRM-46092 will be brought to life for display and use at the MRHS.

Flash!

Just before press time life giving voltages were applied to the RAZ-1. All components came up and functioned as they should! It just shows the result careful engineering and quality

construction. Non directional beacons and WWVB at 60kc were received without difficulty in daylight.

The receiver, preselector and power supply will be properly mounted and prepared for display to visitors. Plus we plan to use it to monitor 500kc and the KSM transmissions on 426kc.

> And Yet ANOTHER Receiver!

We are very fortunate to have in our collection the descendant of the CRM-46092, the Radiomarine AR-8510. This is the main ship receiver that was supplied with the Radiomarine 3U and 4U radio consoles. It was also used at some coast stations, including post war KPH.

This receiver too will be restored to operational status.

In combination, these three receivers will permit us to show the history and development of marine receivers from the 1920s through WWII and beyond, since many of the Victory and Liberty ships that were activated for the war in Viet Nam were equipped with 3U and 4U consoles.

Once restored, all three receivers will be placed in the Treasure Room at the receive site. When you come to visit, be sure to whisper the words "True Believer" to a MRHS member for a Treasure Room viewing opportunity.

> Frank Geisel's Report No. 3 June/July 1946

Beginning in Newsletter No 49 we began presenting FG's KPH reports from the years immediately following WWII after the station was re-opened for commercial service. Let's look in at his reports for

June and July 1946 as Frank continues to battle interference, ships that won't call KPH to clear traffic and operators who find life in West Marin too rugged and expensive.

In June the good news was that the installation of a crystal oscillator in BL2 was completed. However the key clicks from VFN were so broad they were interfering with KPH on 8420kc. Message levels were fairly good. A new man hired last month, N.C. Kumler, decided West Marin wasn't for him and departed..

In July

> MRHS Merchandise

Support the MRHS and look cool at the same time. Such a deal! We've got hats, mugs, T shirts, belt buckles and bumper stickers, all with variations of the MRHS logo. Get a hat and mug for yourself and a put yourself in solid with the XYL by getting her a MRHS hoodie.

Click on the images to go to the True Believers Store

Just click on the images above to go to the MRHS True Believers store and browse our offerings. Thanks!

Whew! Okay, that's it for this issue. Thanks for reading. We very much look forward to hearing you on the air or seeing you in person on Night of Nights. Until then we wish you the best of luck and fair winds & following seas.

73,

MRHS

tty?

What am I looking at here? the recv looks like our ip500 by
wireless speciality but this one is squatter.

and.... what tty is this? verrryyy interesting..
Look under the table.... one heck of a battery bill!
We would of course eb interested in anything on this table for the
museum here at SMECC

From: Hue Miller
Topic: 13873 Message: 13881

Thanks to all who commented on this. I will add a notation to my copy, replacing what was excised, so it will be a little
less of a mystery, at least what was excised – we'll never know "why", I guess.
I noticed on p 175 of the 1928, the Colpitts oscillator, the drawing has C2 and C3 exchanged compared to the text.
I'll add that correction in pencil. Also the text says the plate coupling capacitor (drawing C3; should be labeled C2)
controls the frequency. I do not believe this. That capacitance is in series with the plate-to-filament tube capacitance,
which totals a small figure. The main variables that set the frequency are the coil tap and the feedback capacitor C1.
I read a couple articles on Geo. Sterling today. One mentioned that "Merle, W3OKN had for sale some reprints of
accounts of Sterling's work with RID in WW2. This mention was on the QCWA site. I didn't see any links to that
however. Maybe as time allows later I'll try to run that down.
-Hue Miller

Good News To Report!

> MF Antenna Restored

> KPH and KFS Frequencies Confirmed

> Clarification: Sunday is the Day

> MF Antenna Restored - Your Donation Dollars at Work!

Readers of these pages will doubtless recall that for some time now we have been sharing tales of woe about winter storms, antennas down and how much it will all cost to make things right. Many True Believers stepped up to make contributions, which we have carefully set aside in our bank account.

As we have reported, a December storm took down one of the three poles supporting the Marconi T MF antenna at Bolinas. As Night of Night approached we realized it was impossible to think about the event with no signals on 500kc and 426kc.

A crack restoration team was assembled. We dipped into the funds supplied by our generous donors to buy materials and hire expert climbers. Today we headed out to the Bolinas antenna field with the steadfast objective of restoring the Marconi T. This evening we are tired, sun burned and worried about any poison oak we may have picked up. But! We hare exceedingly happy to report that... The Marconi T has been restored!

Climber ascends the 100ft center support pole for the Marconi T antenna next to the tuning house, Building 42

The Marconi T is the largest antenna at the site. The center vertical radiator is 95ft tall. The top capacity hat consists of two wires with an total span of 736ft.

Our objective was to restore the vertical radiator, restore one span of the top hat to the still standing pole, then restore the second half to a pole as close as possible to the location of the downed pole.

Climber on the center pole watches as the center radiator is pulled up toward him by the ground crew

Step by step the work progressed. The first two goals were met with relative ease but the third was a challenge. We had to support the other leg of the capacity hat in the middle of its span with an insulator mounted on an intermediate pole. A pulley was installed and the support successfully hoisted up.

One of the pulleys used for the Marconi T restoration, retrieved from KPH stock

Then we had to pick a pole at the right distance and direction to stand in for the one that's down. Luckily one of the poles for one of the H over 2 antennas fit the bill. After much bushwhacking we were able to install a pulley on that pole as well and hoist up the the final span of the capacity hat.

Climber installs a pulley atop one of the Marconi T end poles

There is still one major task ahead of us: re-tuning the antenna tuning unit to match the new antenna which will almost certainly have slightly different characteristics compared to the original antenna. But we have a special crew ligned up to do this on Saturday, just in time for Night of Nights. So, if all goes well, we will be back on MF in time for the event.

> KPH and KFS Frequencies Confirmed

In Newsletter No. 51 we mentioned that at press time our use of frequencies for KPH had not been confirmed. We are very pleased to report that confirmation has now been received so stations KPH, KFS and KSM will be on the air from our Bolinas site.

Happy listening!

Check Newsletter No. 51 for a complete listing of frequencies for all Night of Nights stations.

> Clarification: Sunday is the Day

There's no such thing as a shortcut. This was brought home to us when we used last year's Night of Nights announcement as a template for the 2015 announcement.

As many readers were kind enough to report, the wrong day for Night of Nights 2015 was mentioned. We apologize for the confusion. Here below is the correct information for the event:

Date: Sunday 12 July 2015 Pacific Daylight Time

Location: RCA receiving station, 17400 Sir Francis Drake Blvd., Point Reyes National Seashore

Click HERE for a map of the location from Google Maps

Time: Doors open at 3:00pm pdt, first transmission 5:01pm pdt (0001gmt 13 July)

Refreshments: Served

Photographs: Encouraged

Tours: Given

None of this would have been possible without the trust and vision of the Point Reyes National Seashore . The only reason these facilities were spared the bulldozer that visited all the others is that they are on park land. And the only reason they have been restored to operation is that the PRNS staff understood their importance and trusted the MRHS to restore them to life.

13886. WANTED: JW Miller 6183 TV horizontal transformer

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2015-07-13 14:46:43 UTC
From: perls@...
Topic: 13886 Message: 13886

Howdy all--

I'm cooking up another regenerative superhet receiver in the mid 50's style.

I'm looking for two good JW Miller 6183 TV horizontal oscillator coils-transformers. These things look like over-grown 455KHZ IF transformers but were designed for NTSC TV horizontal oscillator duty. I think these were direct replacements for RCA 205R1. While Miller describes them as tapped "coils" they have a secondary winding as well used as tuned feedback to stabilize multivibrator or blocking oscillators in TV horizontal sweep tracks..

They are approx 2-1/2" high by 1-7/16" square aluminum can with phenolic panels supporting terminals and the tuning slug top 'n' bottom.

PTOP claims to have one... need two..

Any help greatly appreciated.

Thanks for your time.

Robert

13887. AWA

Hi guys,

I am trying to get a copy of the latest AWA Review, and it looks like it isn't for sale yet on the Museum's website. Do you know if a non-member can buy a copy? There is apparently a very good article on Arvin radios in this latest edition. I am interested in this as I have a small collection of metal Arvin radios. BTW, I am looking for a Model 40 "Mighty Mite" 2-tube version to round out my collection.

I have not gone to Rochester in several years and also dropped my long standing membership in the AWA a number of years ago. But while navigating the site I saw that Registration is apparently $60 and a flea market space (as many as you want for one price) is $30. So is it $90 to attend and set up? And how many attend and is it worth it? I am wondering if I should renew my membership and if the convention is worth attending. My primary interest is the flea market and when I last attended many years ago it was a disappointment. Has the new AWA improved this and does the cost bring better stuff for sale?

And I am aware of seminars, great contest, a new museum to see, book affair, and good dinner and presentations, so I am not oblivious to some of the other benefits of attending, and I guess it is a personal decision depending upon what floats your boat. I truly did enjoy Canandaigua and early Rochester. The real Glory Days.

Comments appreciated.

Thanks,

Joe

From: Brian Harrison
Topic: 13889 Message: 13889

Hi all,

I'd like to buy or borrow any of the following manuals:

TB SIG E1 German Radio Sets, Torn. Fu. d1
TB SIG E2 German Radio Set, Torn. Fu. d2
TB SIG E3 German Torn E.b. <https://www.dropbox.com/s/i7g37b6czg075jz/TB_SIG_E3_KN4R.pdf>
TB SIG E4 German Radio Set Receiver, Spez. 445 b Be.
TB SIG E5 German Radio Transmitter, 10 W.S.c and 10 W.S.h
TB SIG E6 German Radio Transmitter, 5 W.S./24b-104
TB SIG E7 German Radio Set, Fusprech. a.
TB SIG E8 German Radio Transmitters, 20 W.S.c and 20 W.S.d
TB SIG E9 German Radio Transmitter, 100 W.S.a.
TB SIG E10 German Radio Transmitter, 80 W.S.a.
TB SIG E11 German Radio Transmitter, 30 W.S.a.
TB SIG E12 German Radio Sets, Feldfu. b. and Feldfu. c.
TB SIG E13 German Radio Set, SE469 A.
TB SIG E14 German Radio Receiver, Kw.E.a
TB SIG E16 German Radio Set, Torn Fu. g.
TB SIG E17 Japanese Radio Set, Model 94 Mark 6 Wireless Set
TB SIG E18 Japanese Radio Set, Model 97 Light Wireless Set
TB SIG E19 Japanese Model 94-5 <https://www.dropbox.com/s/lv9ce17bfujc7hn/TB_SIG_E19.pdf>
TB SIG E20 Power Supplies for German Radio Sets
TB SIG E21 Japanese Radio Set, Mobile Wireless Set C Mark 1 M
TB SIG E22 Japanese Model 95-4
<https://www.dropbox.com/s/wh01j3abe7ayaqa/TB_SIG_E22_KN4R.pdf>
TB SIG E23 Japanese Radio Set, Model 94 Mark 2B Wireless Set
TB SIG E25 German Radio Transmitter, 30 W.S
TB SIG E26 Japanese Model 94-2
TB SIG E28 Japanese Radio Set, Mobile Wireless Set B
TB SIG E28 Japanese Mobile Wireless Set B
<https://www.dropbox.com/s/lvyuzdley5a4yew/TB_SIG_E28_KN4R.pdf>

The ones highlighted above are available as pdfs via Dropbox. If you are prompted to join Dropbox just close that window and afterwards you will be able to download - you don't have to have a DropBox account.

Even for the existing ones above I would be interested in an original manual so I can rescan….

Tnx and all the best,

brian

I just built a more permanent crystal radio. I love how sensitive my
WE 509W are. I can hear 5 stations, and 3 of them are full volume.
My only gripe is they are incredibly uncomfortable. I don't know how
professional radio operators could stand wearing them for a whole
shift.

Regards,
Chris Maness

Chris, Glad to hear that the 509W are working out for you. I don't know if they made ear muffs to go on them. But you can talk some of the tension off of the head band.

13892. Indexes to U. S. Antique-Electronics Publications

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2015-07-21 19:08:16 UTC
From: Ludwell Sibley
Topic: 13892 Message: 13892

The Tube Collectors Association Web site now houses a suite of indexes to U. S. antique-electronics publications (go to www.tubecollectors.org and click on "Archives.") Individual items in the set cover:

- All AWA publications, 1960 through 2005 (the "Old Timer's Bulletin" / "Journal"," the "Review," the Tube Collectors Group "Fact Sheet," the five independent monographs, and the 50-year commemorative booklet).

- All AWA pubs from 2006 through mid-2015.

- The Dowd-RCA Archive held by AWA (an improved version of the 1992 index).

- All TCA publications ("Tube Collector" and Special Publications), 1999 through mid-2015

- All issues of "Vacuum Tube Valley."

- All issues of the Antique Radio Club of America "Gazette."

"VTV" and the "Gazette" are included because, while both are out of print, they contain original material that is still of value. "VTV" is available on the Web these days, while some collectors still hold copies of the "Gazette."

This material is offered on the theory that an index makes the difference between "a pile of literature" and "research."!

This is in addition to a cache of oldie tube catalogs available under the same tab.

The files are posted in both DOC and PDF formats.

It is well to note that the Mid-Atlantic Antique Radio Club has an index to its "Radio Age," recently updated and going back to 1994, on its site www.maarc.org.

Enjoy!

Ludwell Sibley

13893. Index to the Receiving Tube Manuals - Second Edition

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2015-07-24 17:47:39 UTC
From: Dale H. Cook
Topic: 13893 Message: 13893

I have completed and posted the second edition of my Index to the Receiving Tube Manuals:

<http://plymouthcolony.net/starcity/radios/pages/tubeindex.html>http://plymouthcolony.net/starcity/radios/pages/tubeindex.html

It includes tube manuals in my collection published trough 1950. The new entry page, linked to above, contains links to online copies of all manuals indexed.

This was completed rather sooner than I expected because I changed my compilation method somewhat, and because I had to do less scanning and reworking of scans than I had anticipated. The third edition, covering manuals published through 1955, will probably not be ready until early 2016.

Dale H. Cook, GR / HP Collector, Roanoke/Lynchburg, VA
http://plymouthcolony.net/starcity/radios/index.html

13894. Index to the Receiving Tube manuals - Update

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2015-07-24 21:55:11 UTC
From: Dale H. Cook
Topic: 13894 Message: 13894

A couple of kind souls pointed out that the notes all appeared at the end of the file. I have corrected the setting that caused that effect and have re-posted the file.

13895. Spark Gap Radio Photos

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2015-08-05 22:11:35 UTC
From: cpitcher@...
Topic: 13895 Message: 13895

While real radios may glow in the dark, our 100+ year old transmitters go zap in the dark, light up the room, and fill it with the sweet smell of ozone.

Curious about old Spark Gap transmitter, Coherer and Magnetic Detectors, Loose Coupler Receivers? Want to check out Marconi and other, big spark keys? We also have some very rare documentation in the files folders.

The spark Gap Collectors group has 235 photos (in twelve albums) of very rare gear going back over 100 years.

NOTE: Due to some changes Yahoo made...you will want to view photos by clicking on the Albums tab rather than the photos tab. I know that is counterintuitive, but that is the only way Yahoo will let you browse all of them at your own pace.

Come visit us: Spark Gap Radio Collectors
https://groups.yahoo.com/neo/groups/SparkGapCollectors/info We would also like to see your items.

It was used in the IP-37/APA-74, a five channel real time radar pulse analyzer for countermeasures surveillance that was also supported by a motion picture camera. This is back before sampling techniques were used. I seem to recall gifting my APA-74 to toober...it was too late for my narrow period interest. The tube is a beast.

13904. DECORADIO book

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2015-08-17 17:24:34 UTC
From: Brian Harrison
Topic: 13904 Message: 13904

All,

At the AWA meet Book Fair I picked up a new book (to me anyway) which is one of the most beautiful books I have ever seen, on any subject:

http://www.amazon.com/Deco-Radio-Most-Beautiful-Radios/dp/0764346059/ref=sr_1_1?s=books&ie=UTF8&qid=1439831939&sr=1-1&keywords=decoradio <http://www.amazon.com/Deco-Radio-Most-Beautiful-Radios/dp/0764346059/ref=sr_1_1?s=books&ie=UTF8&qid=1439831939&sr=1-1&keywords=decoradio>

If you are interested in radio as art you'll want this book gracing your coffee table or display room.

Best regards,

brian

Eric Wenaaa gave it a good review in the Winter 2015 issue of the AWA Journal, and I bought a copy on his recommendation.

As Eric noted, the black background used on all the radio photos tends to obscure the details of those with darker cabinets, but it works well for the more colorful sets.

13906. Radio and the Disappearance of Amelia Earhart (and Fred Noonan)

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2015-08-17 17:06:50 UTC
From: Brian Harrison
Topic: 13906 Message: 13906

All,

Thank you for the opportunity and privilege of delivering this session at AWA NY this year.

Here’s a downloadable copy of the final Powerpoint (with embedded movies, about 360 MB):

https://www.dropbox.com/s/ztgp1tmmyjue7f5/Amelia_Earhart_AWA_NY_2015.pptx <https://www.dropbox.com/s/ztgp1tmmyjue7f5/Amelia_Earhart_AWA_NY_2015.pptx>

(if you are prompted to join or log into DropBox just quit that window to continue to the download - no DropBox account needed to download :-)

Or just watch these youtube videos below in order to get a sense of the latest information around the search for Amelia and Fred:

Take-off at Lae (loses her receiving antenna):

https://www.youtube.com/watch?v=GaMp5SibXRk <https://www.youtube.com/watch?v=GaMp5SibXRk>

Last Radio Calls:

https://www.youtube.com/watch?v=wiUScofSlPw <https://www.youtube.com/watch?v=wiUScofSlPw>

The Search for Amelia and Fred Begins:

https://www.youtube.com/watch?v=N2uNOlQslJ8 <https://www.youtube.com/watch?v=N2uNOlQslJ8>

Radio Signals Heard and Triangulated to Gardner Island and SWL Reports Come In:

https://www.youtube.com/watch?v=aPko65DtPtM <https://www.youtube.com/watch?v=aPko65DtPtM>

The Smoking Gun (artifact):

https://www.youtube.com/watch?v=bFKCkN6C5JQ <https://www.youtube.com/watch?v=bFKCkN6C5JQ> (this last one is a long video, but worth it!)

and if you want more, google “youtube Tighar Amelia”

or read this terrific book:

http://www.amazon.com/Finding-Amelia-Story-Earhart-Disappearance/dp/1591143187/ref=sr_1_2?s=books&ie=UTF8&qid=1439830387&sr=1-2&keywords=finding+amelia <http://www.amazon.com/Finding-Amelia-Story-Earhart-Disappearance/dp/1591143187/ref=sr_1_2?s=books&ie=UTF8&qid=1439830387&sr=1-2&keywords=finding+amelia>

Feel free to redeliver this presentation to your friends, ham club, etc.

Thanks again and everyone please make plans to attend the Antique Radio Charlotte / Crypto meet next March in Charlotte NC!

http://www.cryptosymposium.com <http://www.cryptosymposium.com/>

Thanks and all the best,

13908. WTB: For RCA AR-812 left and right battery doors

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2015-08-18 13:55:49 UTC
From: pacquerat@...
Topic: 13908 Message: 13908

Friends,

I need both battery doors for the for RCA AR-812 in fair condition. I understand there were two makers of this cabinet. I need the doors that will accept the alignment pins on the bottom. I do not care if wood is a little chipped. Must have at least one pull knob. Paper directions glued to the backs are not important.

Thanks!

Chas

13909. My comments on AWA Conference 2015

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2015-08-18 15:57:36 UTC
From: kd4hsh@...
Topic: 13909 Message: 13909

OK kiddies, here are my comments on the AWA Conference 2015 for what its worth..

AWA Convention 2015

Reflections on a 4 ½ day event.

Weather was great… In the low 80s and low humidity.

Tuesday was the official opening of the museum Phase 2. The museum was under a deadline to have the VOA transmitter bay and control room elements on display. A deadline dictated by the terms of the agreement that would allow federal handover to a 501C3 entity. I realized last year this would be a truly daunting task for the available manpower and budget. I found myself a little disappointed in the build-out of this part of the museum. The VOA hardware and some support documentation and artifacts are indeed on exhibit but construction around it has a long way to go. I was told that a contract construction crew is due in next week to build walls for the theater, install finished flooring and other internal dividers needed for the space.

Wednesday was a day for the Book Fair. The vendors bring huge quantities of rare and desirable documentation on ALL aspects of the electrical arts. I know of no other scheduled event for the vintage communications enthusiast that brings such a quantity of this specific material to the retail market. During the day, the first of the forums are under way. The first relate to amateur repeater operations then on to trends in contemporary commercial broadcasting. After lunch a presentation on how the military is having to rethink its strategies for communications in the modern world… The afternoon ended in a brief history of recording… (In that presentation, I had expected that the narrative would have carried through into electrical recording on disc and magnetic tape; but to my surprise, pretty much stops with the Poulsen Telegraphone wire dictation machine of 1903!)

During the early afternoon, people are starting to set up in the flea market and there is a LOT of dealing going on even though the flea market is not scheduled to begin until 6 AM the next day (Thursday). Obviously I am in the minority in thinking that there is much more excitement and an increased sense of having a fair chance of finding new goodies for my collection when the flea market has a definite start time.

Thursday morning saw the usual ‘dribble start’ of recent years at 5:30 AM with all not open for business till after 9:30 AM. I think Gary Alley said that there were 40 vendors doing business at 10 AM. Certainly a discouragingly small turn-out to such a large parking lot under great weather conditions. There were indeed some exotic and desirable items changing hands (probably mostly on Wednesday afternoon). Sigh….

The Thursday daytime forum slots were filled ‘chockablock’ with high quality presentations both in the demeanor of the presenters and the quality of their screen content. It just about does not get any better than this!

Special thanks goes to a first-time presenter for this conference, Brian Harrison, for his Amelia Earhart saga…. A presentation that continued on (with authorization of course)

significantly longer than the usual allocated time slot. But his program content and delivery kept the audience fully engaged throughout and many remarked that it was a very good presentation indeed.

With my interest in radios made outside of the USA, I was delighted to see Anders Widell's presentation on the radically different broadcast receivers built by Horace Hurm in France during the early 1920s. (Just Google for Horace Hurm images and you will see what I mean.) And Dan Bedford from 'Down Under' gave a delightful talk on crystal sets, and later, a talk during the Midnight Restoration Forum.

Each one of the presentations seemed to attract between 60 and 100 people. (I don't know the official head count for conference registration.)

In the evening I was busy setting up my contest entries. This set up time kept me from seeing most of the Midnight Restoration forum. I did pop in long enough to give a PowerPoint presentation on how I am making museum grade battery replicas.

Friday morning the flea market continued but I'm told that many left by after lunch. With such a small group of vendors, there was just not enough action to hold folks over till the Saturday morning auction… The net result was the smallest auction I can remember. If it was not for the Peckham family bringing in estate items, Rich Estes would have been done in much less than an hour… The Peckham items were just a tiny part of his estate. The nicest items I noted were a Zenith 4R (cracked panel) but otherwise refinished to the N'th degree. A scarce Operadio portable (wish I could have scanned the operator's manual) and a really fine looking Airway Model F (I think). I expected the Airway to be above my pay grade and my travel partner, Mike DeHaan, had decided that he had hit his purchase limit for the rest of the year, so we were on the road headed for the Carolinas at about 10 AM Saturday.

Back to Friday… I missed the AGM at 9 AM because I had been asked to participate in judging the contest. I hope it was recorded and will be on the AWA You-Tube channel at some point. The contest participation was significantly smaller than past years…. Great stuff was there but just not the quantity we have known to appear over the years. My four entries netted 4 blue ribbons AND (ta-dah!) Best of Show for my circa 1927 SRA Radiola M55 (Sweden) exhibit.

After Tom Perera's great emcee/presenter duties at the always good Key & Telegraph forum segment of Thursday, he returned to tell us the real story associated with Alan Turing and the recent movie, The Imitation Game.

John Dilks was not able to attend and make his presentation on Ed Raser so Bart Lee's presentation on the recent efforts to make archeological surveys/digs of sites significant to the history of technological development was moved up. It is always enjoyable to see how enthusiastically Bart delivers his material…

The cap to the 2 ½ days of forums has been the pre 1912 Seminar hosted for many years by Lauren Peckham and more recently co-hosted by Felecia Kreuzer. Felecia has proven to be more than up to the task of carrying on the tradition of this program. We have been fortunate to see many 19th century artifacts at this forum that simply do not get shown in any other event I am aware of. Roger (Rain) Buttignol has stepped up in recent years to bring in artifacts from the 1840s and 50s !

Add three dinners, a special ladies luncheon, a few after dinner presentations, visits to a near-by radio museum; I know of no other opportunity in the USA to experience such an extended conference (not just good swap meet and auction). We would all like to arrive in

the parking lot of our antique radio meets and see a time machine portal that would zip us back to 1999 or transport us to glory days of first person contact with old timers that actually helped contribute to development and build-out of the technology at meet venues like Canandaigua. From what I understand, that’s not likely…. So in the mean time, maybe with some necessary tweaking of the format, I hope that I’ll be able to attend the AWA 2016 conference for the 43rd. time in 44 years.

Thanks for the detailed report! I hope to be back at AWA in 2016, after
two years of unavoidable absence.

antiquewirelessassociation@yahoogroups.com writes:

OK kiddies, here are my comments on the AWA Conference 2015 for what its
worth..

AWA Convention 2015
Reflections on a 4 ½ day event.
Weather was great… In the low 80s and low humidity.
Tuesday was the official opening of the museum Phase 2. The museum was
under a deadline to have the VOA transmitter bay and control room elements on
display. A deadline dictated by the terms of the agreement that would
allow federal handover to a 501C3 entity. I realized last year this would be
a truly daunting task for the available manpower and budget. I found
myself a little disappointed in the build-out of this part of the museum. The
VOA hardware and some support documentation and artifacts are indeed on
exhibit but construction around it has a long way to go. I was told that a
contract construction crew is due in next week to build walls for the
theater, install finished flooring and other internal dividers needed for the
space.
Wednesday was a day for the Book Fair. The vendors bring huge quantities
of rare and desirable documentation on ALL aspects of the electrical arts.
I know of no other scheduled event for the vintage communications
enthusiast that brings such a quantity of this specific material to the retail
market. During the day, the first of the forums are under way. The first
relate to amateur repeater operations then on to trends in contemporary
commercial broadcasting. After lunch a presentation on how the military is
having to rethink its strategies for communications in the modern world… The
afternoon ended in a brief history of recording… (In that presentation, I had
expected that the narrative would have carried through into electrical
recording on disc and magnetic tape; but to my surprise, pretty much stops with
the Poulsen Telegraphone wire dictation machine of 1903!)
During the early afternoon, people are starting to set up in the flea
market and there is a LOT of dealing going on even though the flea market is
not scheduled to begin until 6 AM the next day (Thursday). Obviously I am in
the minority in thinking that there is much more excitement and an
increased sense of having a fair chance of finding new goodies for my collection
when the flea market has a definite start time.
Thursday morning saw the usual ‘dribble start’ of recent years at 5:30 AM
with all not open for business till after 9:30 AM. I think Gary Alley
said that there were 40 vendors doing business at 10 AM. Certainly a

discouragingly small turn-out to such a large parking lot under great weather conditions. There were indeed some exotic and desirable items changing hands (probably mostly on Wednesday afternoon). Sigh….
The Thursday daytime forum slots were filled ‘chockablock’ with high quality presentations both in the demeanor of the presenters and the quality of their screen content. It just about does not get any better than this!
Special thanks goes to a first-time presenter for this conference, Brian Harrison, for his Amelia Earhart saga…. 13913. Ben Tongue (Panoramic) Estate sale, West Orange, NJ...?

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2015-08-23 18:59:09 UTC
From: Brian Harrison
Topic: 13913 Message: 13913

All,

There are some Panoramic panadapter manuals on ebay, seven from a single seller (which is unusual)

http://www.ebay.com/sch/valkyrie10/m.html?item=171902474863&hash=item28062f9a6f&rt=nc&_trksid=p2047675.l2562 <http://www.ebay.com/sch/valkyrie10/m.html?item=171902474863&hash=item28062f9a6f&rt=nc&_trksid=p2047675.l2562>

I discussed this with “Mr. Panadapter” Chuck McGregor who said:

Brian-
Two; things I read yesterday on the web just came together. I noted a reference to an estate sale with the collection of Ben Tongue (once chief engineer at Panoramic). (I don't know if Ben is deceased, or just moving along the progression of retirement living). Anyway, the collection of Panoramic/Navy manuals must be from Ben's estate. Your seller probably got them cheap at the end of the sale, or in a box of stuff. It might be worth inquiring if he has anything else from the same source.
73,
Chuck K7MCG

Here’s the response back from the ebay seller:
…
I believe these manuals came from the Tongue estate. There was a three day estate sale in West Orange, NJ and I did see that name on many items throughout the house. The sale was immense and all radio related. I picked up all of the navy radio manuals I could find knowing they had value. There was a tremendous amount of radios, albums and radio related ephemera. I would say that only one third of the estate sold by the end of the third and last day. I don't know if Mr. Tongue died or went to assisted living. I'm interested in knowing how you knew these items came from his estate? I don't think there was any significant value of the remainder of the ephemera. Large standard radio manuals that possibly have a value between $10.00 and $20.00 were left with a tremendous amount of radio related magazines. I was interested in bound magazines volumes of talking machine and radio magazines, but the asking price was $100.00 per volume and those were gone by the third day. Hope this helps and good luck.

—

Question - did anyone else attend this estate sale?

Tnx and best regards,

brian

13914. Pierson-Delane PR-15

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2015-08-23 19:27:17 UTC
From: Larry Szendrei
Topic: 13914 Message: 13914
Attachments: 2 described; binary payloads are missing from this source WARC

Yesterday a Pierson-Delane PR-15 followed me home from a meet. (It was a package deal with another radio - a Breting 12 restoration project - that I bought.) Patterson originally produced this receiver before it was manufactured by Peirson-Delane.

It appears to be an incomplete restoration, with a freshly-painted cabinet. It is missing the dial glass, and the silkscreened metal "mask" that hides most of the tuning dial mechanism. I would love to find one in order to complete the restoration of this beauty, so any suggestions would be welcome.

There's a puzzle, though. All the PR-15 photos I've found in books, advertisements, or online show an oval dial opening/escutcheon, as in the attached file PR-15_2. This is rectangular on mine, shown in PR-15_1. Can anyone shed any light on this?

Thanks for any leads on the missing part, and the escutcheon mystery.

Ben
passed away not long ago. It was posted in the broadcast
radio magazines. Ben
in his later life was real active in high performance
crystal sets. I would
have loved to have been at that sale. I bet there was a lot
of good stuff that
went in the trash. L

Subject: [AWA]
Ben Tongue (Panoramic)
Estate sale, West Orange , NJ ...?

All,

There
are some
Panoramic panadapter manuals on ebay, seven from a single

seller (which is
unusual)

http://www.ebay.com/sch/valkyrie10/m.html?item=171902474863&hash=item28062f9a6f&rt=nc&_trksid=p2047675.l2562

I
discussed this
with “Mr. Panadapter” Chuck McGregor who
said:

Brian-

Two; things I read yesterday on the web just came together.
I noted a reference
to an estate sale with the collection of Ben Tongue (once
chief engineer at
Panoramic). (I don't know if Ben is deceased, or just
moving along the
progression of retirement living). Anyway, the collection of
Panoramic/Navy
manuals must be from Ben's estate. Your seller probably
got them cheap at the
end of the sale, or in a box of stuff. It might be worth
inquiring if he has
anything else from the same source.

73,

Chuck K7MCG

Here’s
the
response back from the ebay seller:

…

I
believe these manuals came from the Tongue estate. There was
a three day estate
sale in West Orange , NJ and I did see that name on many
items
throughout the house. The sale was immense and all radio
related. I picked up
all of the navy radio manuals I could find knowing they had
value. There was a
tremendous amount of radios, albums and radio related
ephemera. I would say
that only one third of the estate sold by the end of the
third and last day. I
don't know if Mr. Tongue died or went to assisted

living. I'm interested in
knowing how you knew these items came from his estate? I
don't think there was
any significant value of the remainder of the ephemera.
Large standard radio
manuals that possibly have a value between $10.00 and $20.00
were left with a
tremendous amount of radio related magazines. I was
interested in bound
magazines volumes of talking machine and radio magazines,
but the asking price
was $100.00 per volume and those were gone by the third day.
Hope this helps
and good luck.

__

Question
- did anyone else attend this estate
sale?

Tnx
and best regards,

brian

Yes, West Orange is the right place.

The October issue of "Tube Collector" will have a lengthy and highly respectful obituary on Tongue and his role in Blonder-Tongue. He had indeed been a designer at the Panoramic Radio Corporation in the '40s.

I had the pleasure of meeting him as an NJARC member. Thought he was pretty sharp. That's too simple: after looking into his achievements and patents, he comes across as b-r-i-l-l-i-a-n-t.

Hi Lud,

Yes, brilliant Ben Tongue certainly was. And great to talk to, as well as his business partner, Isaac "Ike" Blonder, who was a real character.

Some folks may not be aware that Blonder-Tongue also made consumer electronics for a time.

I have fond memories of bringing a small AM-FM radio to one of our meetings, and Ben and Ike Blonder both autographed it. I told them that "this thing sounds pretty good" and Ben responded "well, of *course* it does!"

Ben told the NJARC group an interesting little story: the major tube manufacturers would give them a 5% discount on tubes that were custom-labeled for B-T. But they had to "eat" any defective tubes.

I was surprised to see that apparently there are no links to the tubecollectors.org online material. They have quite a few tube data publications
online.
I believe this is where I am going to send the small collection of somewhat uncommon tube publications I have, such as the Beam-X tube booklets. I thought about Frank's pages but I am somewhat leery about donating materials to (what I see as) a one-person project with a rather fuzzy definition.

I have not found any receiving tube manuals there of the type that I have indexed. The site has many data sheets, and some transmitting tube manuals, but apparently not the receiving tube manuals. My work is entitled "Index to the Receiving Tube Manuals."

Radio engineering principles. by Lauer, Henri; Brown, Harry L.
ha! the one book out of thousands we did not have.
found it in archives dot org but would probably like a good
crisp scan
if anyone has this on their shelf. this is on page 316 but would
like all the pages on aircraft radio (small section) what is a British
sterling set? they mention that but was this a us design or uk
design!?

13926. Early National for Sale

Yahoo group: antiquewirelessassociation (2010 — 2015)

From: Barry Williams
Topic: 13926 Message: 13926
Attachments: 1 described; binary payloads are missing from this source WARC

Fellows,

I have decided to part with some of my early National receivers. Included is a National SW-4. This is a nicely restored unit with all original parts and a full set of coils. This was National's 2nd shortwave receiver, very much like the original SW2, but including audio amplifiers. If you are interested, contact me directly for pictures and price. This is the most rare of National's SW series. The production run was very short, as it was replaced by the SW-5. This is a beautiful example of National's work. The cabinet, chassis and all interior parts are excellent.

73,
Barry

> I have decided to part with some of my early National receivers. Included is a National SW-4. This is a nicely restored unit with all original parts and a full set of coils. This was National's 2nd shortwave receiver, very much like the original SW2, but including audio amplifiers. If you are interested, contact me directly for pictures and price. This is the most rare of National's SW series. The production run was very short, as it was replaced by the SW-5. This is a beautiful example of National's work. The cabinet, chassis and all interior parts are excellent.

Anyone have an idea of what a reasonable valuation might be for a genuine Marconi coherer in very nice condition?

Thanks.

In the link above it shows a screw-base electrolytic that I need. In America it was made by the Condenser Corporation of America. A dud is OK & don't care if it has any label. It is the size of the can and the style of the crimp at the top that I care about.

Any leads appreciated.... I know it is out there...

Robert

13950. El Faro ship lost with 33 lives but - The Radio Officer was saved!

Some years ago the position of Radio Officer was eliminated. They switched to GMDSS.

Ironically GMDSS has saved the life of a Radio Officer since none was onboard.

"The Global Maritime Distress and Safety System (GMDSS) is an internationally agreed-upon set of safety procedures, types of equipment, and communication protocols used to increase safety and make it easier to rescue distressed ships, boats and aircraft."

Worked as good as the thinking behind it, saving the ships company one Officers salary. What's that ship worth? What are the lives worth?

Remember the Titanic! Without Radio Officers, none would have been saved.

By having ability to contact
Other ships directly on voice via hf ssb and vhf. RDF or verbal gps position reports to local ships or yachts or fishing boats or hams for that matter Bahamian or USA coasties could have had them offloaded or towed before the main storm hit. The satcom based system does not talk to local smaller boats or harbor tugs. He broke down before the storm hit him. Prompt commo locally could have seen the crew rescued and tugboats/salvage vessels from nearby islands and especially nearby cg rescue aircraft there quickly. CW4 Karl.

You think that ship didn’t have HF SSB ?
The distress call WAS heard, but shortly thereafter the ship disappeared.
I don’t know how successful a chopper rescue would have been in 50 foot seas and 120-140 mph winds.
Would the captain had called for a tow before his engine failed?
When the engine failed, would anyone have headed into the eye of the hurricane to provide a tow?
How would a radio operator have changed the outcome?

Hue. You are right if the engine failure happened when the storm hit. When he left port he felt he could sail around/before the storm hit his planned route. He did not get out of the storms path in time because his engine failed before the storm hit the ship. There was a small window in which a strong tug could have towed him out of the ay or at least the crew could have been offloaded before the storm arrived. The captsin had no intention to sail into the storm but to make a quick passage before it got there. I am sure worries for cargo and salvage issues delayed his action until too late. I have sailed these waters, experienced numerous hurricaines and gales and lessrr storms as crew on fishing and research vessels and come from a line of ses people. Any ship any ocean steam and sail master ratings tickets held by grand dad and great grand dad with whom i grew up. Dad had 2nd telegraph and able bodied seaman papers and served in ww2 convoys to Murmansk through immense storms. Have studied seamanship and navigation and was also radio op. Sent distresd call on 500kc in Med. Sea during massive gale when regular op was badly injured. Also wrote several books and magazine articles on maritime radio and was regarded as an expert in field . So the opinion i gave is at least an educated one. Not infallible simply an opinion based on facts as reported and knowledge of sea and maritime comms.

A further thought to which i alluded earlier. When a tug rescues your boat they get big fee. But only if a crew member stays aboard. If anyone finds/recovers a vessel that was abandoned by all crew that finder owns that vessel and all cargo outright. So that likely was factored into the delay. From what i read, they had excellent chance of beating the storm (which was a lesser storm at the time of departure) as was their plan. However the engine failure before the storm hit changed that. Now he had several chats via satphone with their hq. As they did not call for help or rescue right away they likely hoped to effect repairs in time. But always with the idea of salvage rights in the back of their minds. That was the time to have called for help and a partial rescue of some crew. After that there would have been a brief time for complete crew rescue. I suspect they delayed too long trying to avoid the loss of the ship to a salvage company which could have immediately jumped in the minute the crew and officers left. Remember there are very big salvage tugs that go out, even in hurricaines to rescue and tow ocean liners and freighters. Listen on 4125 usb at night in stormy wx and you can sometimes hear them.

Nevertheless i fault the captain (perhaps under pressure from boss for financial reasons) for taking the calculated risk with the lives of the crew.

Chief Schulte

Reports have it the El Faro went down where the Atlantic is more the 15,000 ft deep.... At that depth, the pressure is around 3.2 tons per square inch. Any container and contents would crushed flatter than a car in a wrecking yard. Bulk heads enclosing sealed compartments likewise. The manifest would tell what container held what such as precious metals, currency and any other highly valued artifacts. Such a salvage operation would not be much unlike what went on with the Titanic. IMHO the engine failure and no power backup for pumps and steering most likely she capsized, cargo shifted... Sadly, it appears that the crew, as expected, were all inside, so the roll must have been very quick. Reports also state that she was to be retrofitted, but with what equipment was unclear.

Very sad...

Chas

Yes, many mainstream economists are wrong about a lot!

The book "Economics in One Lesson" by Henry Hazlitt is an oldie but is timeless in it's accuracy. It used to be available online from the Mises Institute; it may be still.

AWA content: I checked into the AWA PM AM Net last Sunday with my plate-modulated Hartley running it's full-throttle 5W of carrier from Maine. Was heard Q5 by net control W3GMS in PA (400 mi. ATCF and Jeff W3JW in VA. Other stations in the net reported anywhere from little to Q5. What fun!!!

My mother told me about it as a boy. She actually heard the broadcast and panicked as did her sisters at the time. All though they didn't consider leaving an fleeing west at the time. She lived in Altoona.

I seen the TV version many times and have a copy on LP record. The local radio station WBSM has played it, with all the disclaimers every 5 minutes or so.

I've seen the more modern version or at least part of it, rather gross, that may by why it isn't very popular.

One version I liked was The Great Martian War on BBC. They used video and re-enactments from WW1, but cast it as the world war against the Martians. Otherwise there was a recreation of the Orson Wells version using many actors from Star Trek. Of course, the original Orson Wells version gets played every Halloween here. The best of the movies to me was the Gene Barry, George Pal version.

This article has an interesting analysis of how much panic in the US that was actually caused by that broadcast.

http://www.weeklystandard.com/keyword/Broadcast-Hysteria-Orson-Welles%E2%80%99s-War-of-the-Worlds--and-the-Art-of-Fake-News

I've always been a little skeptical about widespread panic over the broadcast. After all, the program returned to dance music many times; are you telling me that those listeners never tuned to a second station during those musical interludes to learn that no one else was covering the Martian Invasion?

I heard the original version in 1938. When the neighbor lady came crying to our house, my Mom had to explain to her that it was only a radio show. There was some concern in the neighborhood but it quickly settled down.

Sometime back in the mid-1980s I read a newspaper article about the program. Maybe it was even on the 50th anniversary.
The article stated that in 1948 (I think it was), a radio station in Ecuador broadcast a recreation of the story, and the locals
were so upset over being played in this way, that they attacked and burned the radio station. I just took a quick look at Wiki
and it does not mention this incident; perhaps some longer article or even book on the broadcast discusses post-1938
rebroadcasts. Anyway at the time I kind of dismissed the Ecuador thing as maybe just a folk myth. But maybe 10 years ago
here, I was listening to an evening interview program on NPR. Some woman was being interviewed; I don't recollect at all
what her claim to significance was, whether she was a women's rights organizer, educator, something like that, that wouldn't
much interest me anyway. One thing she said, I did remember: she said her uncle had worked at this Ecuador radio station,
and after it broadcast its "War of the Worlds" recreation, an angry mob had attacked the station, and her uncle had to escape
out a window – possibly injured, I don't recall. It was interesting to hear this person verify so many years later what I'd dismissed
as myth. In the South American radio stations, it was quite common for the transmitter, studios, offices, everything to be in
one building downtown.
In recent years I read one review in, I think, the N.Y. Times, that compared the "War of the Worlds" theme to what native
Americans experienced as a foreign and inexplicably powerful culture encroached on and decimated theirs. In that case,
of course, disease did not save them; rather the new diseases depopulated North America native populations by 90+ %.
I am quite sure the 1938 broadcast was not implicit with this interpretation. Maybe it's an inherent human fear, after so
many tribes and civilizations have been extirpated over the ages.

From: Hue Miller
Topic: 13978 Message: 13978

Was looking thru RADIO NEWS for June 1942 and in the column, "QRD? de GY"
saw a reference to Karl Baarslag,
author of "SOS to the Rescue", before WW2. Article says he recently was
commissioned a Lieutenant and that
"He decided that unless his union would throw out the Commies and
subversives, he would form a union of his own
and open it up for fellows who were all-Americans......So it wasn't long
before the ROU was stepping into the big
league...."

So does this mean Baarslag was one of the founders of the ROU ? Was the ROU
a competitor to the ARTA ?
(American Radio Telegraphers Union) ? Not a lot of information is
available on any of these nouns. There is no
Wiki entry for Baarslag; I found only an obit from the N.Y. Times, which
also fills in more of the later story:

"Karl Herman William Baarslag, an author and former research director of a
Senate subcommittee headed by Joseph R. McCarthy, died of a heart attack
Tuesday at the Palm Beach Martin County Hospital. He was 83 years old.

Mr. Baarslag, who lived in Tequesta, Fla., and Cape Hatteras, N.C. was
appointed in July 1953 to the Senate Permanent Subcommittee on
Investigations by Senator McCarthy, the Wisconsin Republican whose
controversial career centered on his efforts to suppress Communism.

In 1956, Mr. Baarslag was employed as a consultant by the House Committee on
Un-American Activities. He was a professional staff member of the Senate
Republican Policy Committee at the time of his retirement in 1963.

Earlier, Mr. Baarslag worked for the American Legion as research director on
subversion and un-American activities, and edited a newsletter called Firing
Line.

In World War II, Mr. Baarslag served in the anti-subversive branch of the
Office of Naval Intelligence, reaching the rank of lieutenant commander. "

(end quote.) There seems to be lists of Baarslag related paper held by
universities, but not the actual material itself.
There needs to be more information published on Baarslag, ROU, and ARTA.

I am again triaging paper and I came across some handy forms:

American Radio Telegraphists Association, Inc. - Application for Active Membership
I think I or someone I know will scan these so you can complete them and have them ready to mail in, should the time machine be patched together again.
There's no rush, and you can use the time to fill out the detailed questionaire, such as: what stations you served with, your experience with spark and tube
transmitters, and so on. If your application is accepted after being scrutinized, and your references checked, your ARTA dues will be $1.00 per month. No
subversives need apply!

I am looking for the source of an article, "Making A One-Tube All-Wave Set",
under a heading of RADIO FOR EVERYBODY L. D. Martin, Editor.
I have never heard of this magazine. A Google search did not turn up
anything. I saw this article published in the newsletter of the PSARA club
in the Seattle area, March 1998. The article was photocopied for the
newsletter and the quality is none too good. The article describes a
mid-1930s educational kit, a one-tube radio built on a single board with,
colored parts or wiring to assist the absolute electrical beginner
to assemble it. I have this kit radio and I'd like to be able to get a
better copy of the article documenting it. Any (good) ideas ?
thanks-

13984. Detrol Model 446 AM and Old FM Band Console with phono

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2015-11-10 18:58:40 UTC
From: Allan Pellnat KX2H
Topic: 13984 Message: 13984

A friend of mine brought over a box of 6 volt octal tubes for me to test along with a picture of this radio/phono floor model. After checking out the tubes and finding a few duds and one or two for which I had extras we went on line and pulled the Rider's pages 14-10 and 14-11. The rider's pages show it as having 12V all American tube string and 455KC/4.3MC IFs. Bob Grinder's directory doesn't show any Detrolas models between383 and 558 but Nostalgia Air list Rider's Pages for Detrola does including this a string of 400 series numbers including this 446. Anyone have a clue as to how to date it. What year(s) does Rider's Volume 14 represent? How often did this or any manufacturer produce the same model with either 6V or12V filaments? Allan Pellnat KX2H

13985. Follow Up on DEtrola Model 446

>What year(s) does Rider's Volume 14 represent?

Volume 14 was the first Rider volume published after WWII (published in 1945) and includes models from model years 1942 to 1945. The 1942 models in volume 14 are those introduced late in the model year. Those introduced early in the 1942 model year (that is, introduced in the fall of 1941) are in volume 13.

Topic: 13984 Message: 13987

Rider's XIV was copyrighted in 1944, so it necessarily represents prewar models. As a mass-market FM set, it's probably from the 1940 or 1941 model years.

Same model with either 6- or 12-V heaters? Ummm . . . not real plausible! That 6V6 is suspicious.

Ludwell Sibley

Greetings 29'ers! It's time to dust off all those old chirpers and whooper transmitters and get them ready for this years installment of the Bruce Kelley 1929 QSO Party!! Last year Paul N1BUG beat the pants off of us with 87 contacts so I know there are a bunch of guys looking to beat Paul this year :) I do know there are a 29'ers who don't have to dust off anything because they use their 29 transmitters all year long like Harold KB0ROB and Dave WA8DOF. While I QSO all you 29 guys just once a year in the 29 QSO Party, when I hear your 29 station in the event, it's like hearing an old friend after all these years. I'm bummed when I can't make the QSO because it'll be another year before I have the next chance. I look forward to hearing all you guys. Thanks. 73, Scott WA9WFA

The 2015 Bruce Kelly 1929 QSO Party and W2ICE Special Event Station

The Bruce Kelly 1929 QSO Party is a yearly AWA sponsored event where participants build their own transmitters using the designs, techniques, and tubes that were available in 1929 and earlier, and then put those classic transmitters on the air and try to contact as many other 1929 stations as possible. Since they use early designs, it is a cacophony of whooping, chirping, buzzing, clicking, drifting, swishing, swaying, warbling, and other interesting signals. This is what ham radio sounded like in 1929 and for two weekends in December its 1929 again on the ham bands.

We will again be activating Bruce Kelly’s W2ICE callsign as a 1929 SPECIAL EVENT STATION for the 2nd year in a row! Last year I activated W2ICE from Minnesota for the first time since Bruce’s passing and I was told it was exciting for the 29’ers to hear and working the namesake station of this event! W2ICE is operating as a 1929 station and contacts count just like any other station. We plan to pass W2ICE portable to a different call area of the USA for 2015. I’m not telling you ahead of time where W2ICE portable will be operating from so it will be a surprise. The 1929 QSO Party was started in the early 1990’s and championed for a several years by Bruce Kelly W2ICE, an AWA co-founder. Prior to Bruce’s passing in 1997 he asked his close friend John Rollins W1FPZ to keep the 29 QSO Party going. John Rollins managed the QSO party for several years and renamed it the Bruce Kelly 1929 QSO Party in honor of Bruce. Eleven years ago John Rollins asked me to manage the 29 QSO Party for him and Bruce, and to keep the event alive because it meant so much to both of them.

Dates and Times: First two weekends of December, Saturday Dec 5 through Sunday Dec 6, and Saturday Dec 12 through Sunday Dec 13. Starts at 2300Z (6:00 PM EST) Saturday night and finishes at 2300Z (6:00 PM EST) Sunday night, both weekends.

Objective: Contact as many 1929 stations as possible. Contact exchange consists of RST, Name, QTH (State such as ME or MN or NY), last two digits of the year of the transmitters design or publication (such as 29 or 27 or 23, or pick a year if you’re not sure), type of transmitter (such as TNT or TGTP or MOPA or COLPITTS), and power input (such as 6W or 9W).

Rules: Transmitters must be 1929 or earlier types of self oscillators such as the Hartley, TNT, PP tuned grid tuned plate, MOPA, Colpitts, etc. No crystal oscillators. Tubes must have been available during or before 1929. Typical tubes often used are type 10, 45, 27, 211, 71A, 01A. Individual stations can be worked only once on each band over the course of

two weekends. You can use any vintage or modern receiver that you wish. The event is open to all 1929 stations including non-AWA members and AWA members. You are encouraged to join the AWA and support 1929 radio!

Input Power: Transmitters are limited to a power INPUT of 10 watts or less. However, to help make East-West contacts, power may be increased to 20 watts INPUT between the hours of 0500Z (12 Midnight EST) and 1300Z (8 AM EST). Note this is INPUT power. Power input is calculated by multiplying PA plate voltage x total PA plate current. Example: my plate voltage is 300 volts dc, and plate current is 30 ma, so total input power is 300 x 0.030 = 9 watts input. Stations running more power than this are considered “modern” for this event and do not count.

Frequencies: The QSO Party typically operates between 1800 to 1810 Kcs, 3550 to 3580 Kcs , 7100 to 7125 Kcs, plus or minus depending on QRM. 40 meter activity is up significantly because it offers both night time AND daytime propagation! So when 80 shuts down Sunday morning, I hope to see you on 40m.

Logs: Please submit your log so we can see who you worked and acknowledge your effort! Either electronically email your log to Scott at HYPERLINK "mailto:wa9wfa@..." wa9wfa@comcast.net or mail via post office to: Scott Freeberg WA9WFA, 327 Wildwood Avenue, Saint Paul, MN 55110. Logs must be in the 1929 QSO Party log format otherwise it will be difficult to score you. An official 1929 log sheet will be available for download from the AWA website. Please do not email logs to any other email address except to the WA9WFA account. Because of email problems in the past, I will acknowledge receipt of all email logs. If you do not receive an acknowledgement within a couple weeks, better check with me to make sure I received it.

Scoring: Remember that contacts with modern or high power stations do not count. Only count legitimate 1929 contacts. If you are contacted by a modern or high power station, be polite, mention the AWA QSO Party and point them to the webpage for more information, then move on, or QSO them if you wish. We will count contacts with W2AN, the AWA club station. Scoring is simple. Add up the number of legitimate 1929 QSO’s. Example: if you make 15 QSO’s on 80 meters,10 QSO’s on 40 meters, and 5 QSO’s on 160 meters, your final score is 30. All submitted logs will be scored and the results published in the AWA Journal. Please submit logs by January 15, 2016. 73, Scott WA9WFA

Now that would be a wonderful sound to hear on the bands after all these years. Are we talking 83 years? The 29 QSO Party would be just the right place and time to activate that transmitter and engage a radio time machine. I would like to work with you on achieving that goal! If you're not sure you will have time to do that, I would like to encourage you to ship the GG TNT to me at my expense to borrow for a few weekends in December to working the 1929 QSO Party with. I get chills down my spine at just the thought of activating a real George Grammar 29 transmitter in the 29 QSO Party. 73, Scott WA9WFA AWA 1929 QSO Party Manager

Scott - pretty easy to build another one from the plans in QST too...
I would think the hardest part is winding the coils out of the hollow copper tubing and having it look nice.
https://www.prismnet.com/~nielw/tnt/tnt.htm plans here.
Now this fellow lists this as " The November 1930 issue of QST" but I am sure a version of it was conceived prior to that date? I need to trace time of inception.

I need a pair - or several pairs of 10's or 45s (10s look cooler!) the shoulder ones to run and a set of globe ones (look big but do not need to work) when we put it back under glass. There are some 01a or other small dome top 4 pin tubes in it as I remember but they look whimpy.

I would need to lash a power supply together or try to run it off the Heathkit sb-101 supply or something similar.

any tubes (10s 45s vt-25s or??) can be mailed to
COURYHOUSE/SMECC
Attn Ed Sharpe
5802 W Palmaire Ave
Glendale AZ 85301

For a real nasty signal there is a rig with a rotary gap and a 1 kw Thordarson transformer... it used to belong to Irv(?) Rassmusen in California and Paul Giganti fixed us up with it eons ago.

I also recall seeing a GG one tube transmitter on a boad in the glass case too but it is one someone had built in recent years (30 years? ago?) still serves nicely to show the tech... but you can tell it is not 'of the era' it was designed.... too shiny!)

Well I am finally licensed with a general license (KF7RWW) thanks to no code.

I could have gotten a general in 6th grade but could not master code... theory a snap... but no even code at 5 wpm! sad!

But I spent my time as everyone else's engineer and my main interest was building stuff and once air checked lost interest in it and on to another project. I had a big interest in broadcasting

Jon Dilks has an excellent section on this transmitter too see:
http://www.eht.com/oldradio/arrl/2008-11/classic-1930-transmitter.htm

I would love to find an old power supply or the parts to make one that looked period line in Dilks page.

I just read on the antique radio forum the our friend
Alan Douglas passed away last night.
No other details at this time, when I learn something
more I'll send it out.

RIP my friend, you were a historian of the first order
and you will be missed.

I sure hope this news is a hoax!
I never got to visit Allan & his museum. I've gabbed with him at the MIT flea and had him autograph his 20's radio manufacturer books and the test eq book. I've corresponded with him numerous times over the years.
If he has left us RIP Allan! Thank you for your great contribution to preserving the history of commercial radio. 73 forever.

Hi Mike,

Interesting. According to Webster's, Kluge or Kludge is "origin unknown" circa 1962. But who really knows....

Did the RME receiver make it a Kludge? ;-) Not knocking RME, but it's a curious choice....

Kludge - Wikipedia, the free encyclopedia
Wikipedia › wiki › Kludge
Mobile-friendly - The term kludge would then seem to have independent origins, possibly in Britain.

Sent from my iPhone 5. It was developed from alien crash debris found in Roswell New Mexico

John –

Well, we all know what the term “kludge” means, at least to us. A collection or assemblage of equipment or parts in a haphazard manner, without any attempt to make it look neat, but just to make it work. As far as I know it did originate from that advertisement and the guy’s name. There may even have been an article in an early issue of CQ about it. I do not believe any of them were ever delivered. Also, as I remember, the word has been in use since I have been involved in radio which started in earnest in the late 50’s. 73 – Mike

When I read the statement that it would look good in your living room, I immediately looked for the date on the page. My first thought was that
this must have appeared in the April issue. But it appears to be a straightforward ad. That the name is ‘Kluge Electronics’ has nothing at all to do
with the way we use the term ‘kludge’. It’s not at all a ‘kludge’ but a well-engineered but poorly targeted product. How many hams nationwide
would want this monster? And it didn’t take into account either the rapid changes in radio equipment that were taking place, with the trend to
smaller equipment, and frequent replacement by more advanced equipment. The thing was kind of obsolete even at the time of the product
announcement.

My "take" on the ad is that it was never produced, but is a startup attempt. After all, it's not a photo, but rather a slick drawing. And, if a kluge is a hastily thrown together assembly that works, this thing is just the opposite; spiffy looking but questionable operability. I agree with the question "Who would actually want this thing in their living room?" Still, it's the only advertised item I've ever seen with the name Kluge attached to it.

It would be interesting and informative to know if the term was ever used prior to the date of this ad, for example during WWII.

That's what I was wondering too, Mike. If the pejorative term 'kludge' was actually used at the time. If not - viewers certainly wouldn't have seen the ad as a joke
or humorous. I kind of suspect the term came about much later, but that's purely a guess.
Supposedly the term 'bug' dates back to early computers using relays - but I have seen it used in 1930s articles, way before computing.

Hi Mike B.,

"I can read Wikipedia as well as the next guy," You talkin' to me? ;-) I got the definition of Kluge out of an actual hard-cover paper dictionary.

BTW, I always enjoy your *excellent* construction articles in Electric Radio. And yes, I saw your pic in this month's ER.

There are some scraps of info about Kluge Electronics on the web. Mike F., you anticipated my next question -- was the "California Kilowatt" ever produced? It doesn't look like it was....bits and pieces of the Kluge story can be pieced togther from the web, but probably not the whole story.

Funny things is, along with "Kluge or "Kludge," "California Kilowatt" was also a derisive term for hams who were running higher than the 1KW legal limit. I'm sure most of you OT's knew that.....

73,

John, KC2UAK

Despite your wife’s opinion, this is not the meaning understood in the USA. Thrown together construction or extemporized, yes, but there is no implied temporary to it here.
-Hue

Subject: Re: [AWA] Kluge

Well my wife who is a linguistic expert says that that word is a British origin
It means something that doesn't go together normally is thrown together to complete a task then torn apart and not used again

Yes on the ‘California Kilowatt’. That plus the name would make you want to see if the month of the announcement was April.
I gather the California term, back then, meant more like “full kilowatt’ than the way it became understood in the 1960s.

Here in the USA, we speak of something “kludged together” or a repair that’s “kind of a kludge”, i.e. like a band-aid repair. There’s no implication of being taken apart. If a ‘kludge’ works, why take it apart?
Also doesn’t matter where the term originated, or where the meaning is different. Note that for colloquial or slang terms, the dictionaries follow and conform to the usage; the usage didn’t arise from the dictionary entry.
-Hue

I have gotten rid of 100s of lbs of radio magazines recently, and looked at a bunch of them b efore moving them out.
I believe I saw this term, California kilowatt, in some WW2 magazine where a ham still in military service was talking
about his post-war plans. I'd sure like to know if anyone has seen the term earlier than in this ad.
Another thing I'd sort of been searching for is the earliest date of the term "walkie talkie". (Yes, please don't tell me
about the first 'movies', etc.)

You take it apart because it was a one time thing. You needed it for one job it work you were done with that job you take it apart.

The first use of "walkie talkie" that I can find in the New York Times archive is in an article published on 11 November 1937 about new equipment for the US Army undergoing testing in Texas:

Also being tried out here for the first time are new portable radio sets, much like the pack sets that announcers for broadcasting companies occasionally use to broadcast sport events.

Some thirty-one of these little short-wave "walkie-talkie" sets, as they are known in the army, are being used during the present motorized march for communication among the various elements of long motor columns, strung out over miles of road."

know what the term “kludge” means, at least to us. A collection or assemblage
of equipment or parts in a haphazard manner, without any attempt to make it
look neat, but just to make it work. As far as I know it did originate from
that advertisement and the guy’s name. There may even have been an article in
an early issue of CQ about it. I do not believe any of them were ever
delivered. Also, as I remember, the word has been in use since I have been
involved in radio which started in earnest in the late 50’s. 73 – Mike

Re: [AWA] Kluge

Hi Mike,

Interesting. According
to Webster's, Kluge or Kludge is
"origin unknown" circa 1962. But who really
knows....

Did the RME receiver
make it a Kludge? ;-) Not knocking
RME, but it's a curious choice....

Hi again Mike,

I'm home now, and the dictionary is at work. I think it's Webster's 10th collegiate, late 90's vintage. An editor friend at work once referred to it as "semiliterate trash" but I enjoy using it instead of the web.

I *especially* like the metalworking skill displayed in your projects.

Regards,

John, KC2UAK

There's another Kluge ad that I found on the web with a man standing behind a large theater curtain, sneaking a peek, that talks about all the "ingenious" postwar developments for ham radio that Kluge is working on. Kluge had big plans, that's for sure. Why they never came to fruition would be an interesting story. I'm going to look into it....

He asked about the machine used to break the codes. Enigma was the machine used by the Germans to encode and decode communications. He may have been thinking of the British team at Bletchley Park, whose most famous member was Alan Turing, which devised the machines known as bombes to discover Enigma rotor settings, and later the Colossus computers to help with decryption.

I was just pointing out that the mechanical machine built for code breaking was such a kludge, that they called it a Heath Robinson after a cartoonist who drew outrageous mechanical contraptions. His work was well known in the UK. I guess kludge is a lot easier to say. I was lucky enough to make multiple visits to see Bletchley Park Museum, the Heath Robinson, Naval Enigma, the partially reconstructed Bombe and Colossus. The curators were wonderful, and loved showing off their work and telling stories to someone from the next generation. They also have a large collection of WW2 receivers, mostly National HROs.

A good document on the early Walki-Talkie is Leonard Anderson's "The first Walkie-Talkie Radio". I don't know who he is, but the 12 page document looks well researched.

It is available at http://www.repeater-builder.com/motorola/pdfs/scr300.pdf

Have fun,

Duncan K2OEQ

Sounds like 'Heath Robinson' = our 'Rube Goldberg'. I doubt that the codebreaking computer was actually such a 'kludge'.
-Hue

From: Barry Williams hroengineer@... [antiquewirelessassociation]
To: antiquewirelessassociation@yahoogroups.com

I was just pointing out that the mechanical machine built for code breaking was such a kludge, that they called it a Heath Robinson after a cartoonist who drew outrageous mechanical contraptions. His work was well known in the UK. I guess kludge is a lot easier to say. I was lucky enough to make multiple visits to see Bletchley Park Museum, the Heath Robinson, Naval Enigma, the partially reconstructed Bombe and Colossus. The curators were wonderful, and loved showing off their work and telling stories to someone from the next generation. They also have a large collection of WW2 receivers, mostly National HROs.

The author criticizes the Signal Corps histories but himself calls the
SCR-300 "the first walkie-talkie". However his own text pictures the earlier
SCR-194/ 195 being carried as
a mobile manpack. That seems to me incomprehensible illogic.

Apparently the author never heard about the Navy's model TBY, which was adopted from a civilian model, the Westinghouse HR, announced for sale
in 1940. Or that the Forest Service model S, from around 1936, was also used in a pack-carried mode.

The first use of "walkie talkie" that I can find in the New York Times archive is in an article published on 11 November 1937 about new equipment for the US Army undergoing testing in Texas:

Also being tried out here for the first time are new portable radio sets, much like the pack sets that announcers for broadcasting companies occasionally use to broadcast sport events.

Some thirty-one of these little short-wave "walkie-talkie" sets, as they are known in the army, are being used during the present motorized march for communication among the various elements of long motor columns, strung out over miles of road."

The Heath Robinson was a mechanical lashup, unlike the quite successful Colossus used to break the teleprinter codes. More akin to the IBM card sorters in technology, but using paper tapes. Tony Sale, who was the driving force behind the Colossus rebuild wrote a nice online article about it. You have to admire their humor. Almost as if the Gadget at Alamogordo had been called Rube Goldberg. The machine exists, near the Colossus, and has a tag calling it "Heath Robinson", it is also referred to by that name in multiple books about Bletchley.

14053. 'The First Walkie Talkie Radio'

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2015-11-20 19:54:21 UTC
From: Hue Miller
Topic: 14053 Message: 14053

There are a couple inaccuracies in Leonard Anderson's article about the SCR-300 walkie-talkie. The term actually dates to 1937, not the beginning of WW2.

I don't understand his criterion for naming the SCR-300 as the "first walkie-talkie". He seems not to know that the Navy bought Westinghouse's backpack HR radio in 1940 and with some changes, made it their model TBY walkie-talkie. Or that the Forest Service used their model S portable radio in a backpack mode. Or that a radio his own text pictures, the SCR-194/ 195, was actually the first radio commonly called "walkie talkie". Odd. Or is his criterion that the SCR-300 was the first portable manpack radio to achieve a 5-mile range? That would be an odd criterion, and questionable too, as even the simple 2-tube SCR-194/ 195 could achieve this, depending on local ground conditions.

One Army veteran told me he talked on a SCR-194 walkie-talkie from Presidio, San Francisco CA, to another at Fort Monmouth NJ. Of course that's a freak occurrence, but that's more than 5 miles and would qualify it even under Anderson's 5-mile criterion.

The way the big heavy receiver retracts down into the table so you have a flat desk area – those receivers were heavy! I wonder if there was a power assist to the mechanism? Otherwise lots of OTs couldn’t have managed it.

Hue,

That forestry service set has always interested me. The Australians built a similar set, the ATR-4 as I recall, which they used in Coast Watching and Spotting. QST did a really good article, it would be an interesting project to build one. I bought an ATR-4 in Australia, just never got it shipped.

Hue,

That forestry service set has always interested me. The Australians built a similar set, the ATR-4 as I recall, which they used in Coast Watching and Spotting. QST did a really good article, it would be an interesting project to build one. I bought an ATR-4 in Australia, just never got it shipped.

Hi again Mike,

I'm home now, and the dictionary is at work. I think it's Webster's 10th collegiate, late 90's vintage. An editor friend at work once referred to it as "semiliterate trash" but I enjoy using it instead of the web.

I *especially* like the metalworking skill displayed in your projects.

Hi Mike B.,

"I can read Wikipedia as well as the next guy," You talkin' to me? ;-) I got the definition of Kluge out of an actual hard-cover paper dictionary.

BTW, I always enjoy your *excellent* construction articles in Electric Radio. And yes, I saw your pic in this month's ER.

There are some scraps of info about Kluge Electronics on the web. Mike F., you anticipated my next question -- was the "Callifornia Kilowatt" ever produced? It doesn't look like it was....bits and pieces of the Kluge story can be pieced togther from the web, but probably not the whole story.

Funny things is, along with "Kluge or "Kludge," "California Kilowatt" was also a derisive term for hams who were running higher than the 1KW legal limit. I'm sure most of you OT's knew that.....

73,

John, KC2UAK

□

Thanks to all who replied regarding my question on
the origin of the word
Kluge. I can read Wikipedia as well as the next guy, but
the attached ad
is the first time I have seen the word associated with a
piece of electronic
equipment and an actual person's name, other than rumor
and speculation.
Also, FWIW, klug is the German word for clever.

Well, we all
know what the term “kludge” means, at least to us. A
collection or assemblage
of equipment or parts in a haphazard manner, without any
attempt to make it
look neat, but just to make it work. As far as I know it
did originate from
that advertisement and the guy’s name. There may even
have been an article in
an early issue of CQ about it. I do not believe any of
them were ever
delivered. Also, as I remember, the word has been in use
since I have been
involved in radio which started in earnest in the late
50’s. 73 – Mike

I knew we would hear from The Thought Police sooner or later.

OK, John, while looking up "kludge" last night in a 1968 Webster's -- it was not there -- I happened to look at the word "jigger." To my amazement, one definition was "in radio, an oscillation transformer."

Has anyone ever heard that term? I had not.

Topic: 14053 Message: 14068

One Army veteran told me he talked on a SCR-194
walkie-talkie from Presidio,

San Francisco CA, to another at Fort Monmouth NJ. Of
course that's a freak

occurrence, but that's more than 5 miles and would qualify
it even under

Anderson's 5-mile criterion.

-Hue Miller

Hue,

This is not really a freak occurrence... It's the VHF low band opening up, and it happens a LOT. E-skip seems to peak in early summer.
I've worked F2 openings to other continents with 200 milliwatts...
I have reports from users of 40-50 MHz Forestry radios of not being able to contact people a few miles away (here in the Pacific North West), but being able to work other stations in the Mid West or further East...
And then there are band openings and ducted traffic on the 30-50 MHz Land Mobile FM frequencies...

Guys. The term Walkie Talkie was coined by Motorola. BTW it was then called Galvin Mfg Co. Motorola was the product name of their radios. They later changed the company name to Motorola, which implied "music on wheels). The terms " walkie talkie and handy talkie" arr trade marks of that company. It was used to describe the scr300 and a back pack type radio. There was a big photo of the back pack set being worn and tested by my Signal Corps officrrDad in the Mot museum. 73 Karl WA2KBZ Sent on a Sprint Samsung Galaxy S® III

Great info. Just one amplification: “Motorola” was the product name of their AUTOMOBILE radios! Motor + the very common ending -ola, as in Victrola, Pianola, Amberola…….

Guys. The term Walkie Talkie was coined by Motorola. BTW it was then called Galvin Mfg Co. Motorola was the product name of their radios. They later changed the company name to Motorola, which implied "music on wheels). The terms " walkie talkie and handy talkie" arr trade marks of that company. It was used to describe the scr300 and a back pack type radio. There was a big photo of the back pack set being worn and tested by my Signal Corps officrrDad in the Mot museum.

Thanks for your information, but how do you explain that the SCR-194/ 195 radio was called "walkie talkie", before Galvin ever produced any FM packset? You read right here that one fellow had dated the term to 1937, so how do you conclude differently? It does not matter that Motorola was the first to trademark a name.

There's no record at the US patent and trademark office that Motorola ever trademarked "walkie talkie". From the 1937 article in the NY Times that I quoted earlier, I believe this term was in common use at the time Motorola got into the business and quite possibly not eligible to be trademarked.

Motorola does have two live trademarks on Handie-Talkie, one filed in 1948 and one in 1961, both stating first use as 1942:

http://tmsearch.uspto.gov/bin/showfield?f=doc&state=4809:79kgrr.2.2
"PORTABLE RADIO TELEPHONE TRANSMITTER-RECEIVER. FIRST USE: 19421100"
http://tmsearch.uspto.gov/bin/showfield?f=doc&state=4809:79kgrr.2.1

This page at Motorola's site describes the creation of the Handie-Talkie, which unlike previous two-way radios was small enough to be handheld:

http://www.motorolasolutions.com/en_us/about/company-overview/history/explore-motorola-heritage/handie-talkie-radio.html

It would be useful if anyone quoting "facts" about the origins of the walkie talkie would provide links to documented evidence or verbatim quotes with the source stated.

In the past when I saw photos of the SCR-194/ 195 with the caption using the term “walkie-talkie” I should have noted the date and venue.
I will do that from now on. There are quite a few photos of this set in old Radio News and National Geographics magazines, and some Army
publications. Granted, most of them do use some term like “portable transmitter-receiver” instead.

Actually, the SCR-194/ 195 was in service in 1938. Motorola did not make it. Galvin did not make it. The circuit was similar to 5-meter ham band radiotelephone circuits widely published in the 1935-1936 era. The only real innovation was to make it totally carry-able. In fact in reading about the development of this radio, I learned it was first thought to be only usable when taken off the carrier's back and set down and operated. Only later did they realize that the radio could be used as well 'on the move'. Maybe this was about the same time the 'walkie talkie' term originated. I am wondering now where I read that article on the SCR-194/ 195 development; it may even have been in QST, in which case I noted the date - somewhere.
The later Westinghouse model "HR" - "Handy Radio" - was announced in 1940 in Electronics magazine. It was also manpack-portable and the
Navy picked it up the same year, upped the higher frequency end, and named it their TBY. I suspect the 'smokejumper' Forest Service radio type SJ, a small 9-meter band portable, also predated any Motorola portable radio. The Japanese army also had a portable small walkie-talkie type in 1936, the model 94-5, again, similar circuit to the 5-meter band ham radios. In any case, people were calling the U.S. Army's 5-11 meter portable radios "walkie talkies" well before WW2 and Motorola. You are free to believe what you want, but 2+2 still=4.
It just occurred to me, one of the U.S. Navy predecessors to their portable MAB, one of the earlier versions, may also have predated any Motorola-Galvin product.

No, I’m not talking about the SCR-203, which was the mulepack radio. (I have the saddle carrier; still hoping to find the radios, altho I think this will most likely never happen.) I’m still talking about the SCR-194/ 195 (BC-222 and BC-322) portable radios.
There are lots of photos of these around. One was recently on Epay with the original but emptied-out battery. I have 2 of the radios, both models, myself, complete.
There was an SCR-203 manual on Epay about 5 years ago. I thought this was one I "needed" and I was in the bidding. I could hardly believe it when the bidding went up over $1500 - this for one of the "small format" thin 1930s booklets. I think I dropped out at that area, thinking, well, I'm sure to find one somewhere, and if I don't, well too bad. Anyway several years later I found I actually did have the manual in my stock. It is better to be organized, I'm learning (at last.) -Hue

Small data point: in the Time-Life series of photo books on WW2, there's one on the 'Italian Campaign'.
On the back cover is the photo of some American troops advancing on a castle or hilltop (I don't own the
book anymore.) Anyway you can make out on the back of one soldier, the SCR-194 type radio – it's pretty
obvious from the bag and antenna profile. I discovered this myself. None of us thought the radio had ever
gone near a combat zone and everyone was surprised to see such a seemingly obsolescent radio being
used in combat. By D-Day only the SCR-300 FM talkie was in this role, both in the U.S. Army and Marine
Corps.
(I know, I should document 'everything'.)

Now there's a set I always thought was weird & kludgey. Chest set with the horn microphone, and the heavy power supply unit, and the radio stick itself.
It surely WAS used in the war though. In the Aleutian campaign (photo in Electronic Industries magazine, 1943) and in North Africa (book "The Battle
is the Payoff").

Been working on a CW pond hop attempt on my NO 19 Wireless Set with GW3OQK. So far we have had a couple of "iffies" but nothing verifiable yet. (We want a recording) The No19 has a very characteristic sound on CW so it is easily found. We try everyday if possible. If I reach him on the No 19 barefoot he has promised to reply on the T1154. We are using the same freq and same schedule ever day. Meanwhile I am starting to get my pre29 stations all on one table for the BK. I need to double check my power on the 211 Hartley to make sure I am not over the limit before I decide to include it this year. Last year I worked Bugsy(--BUG) with everything I have (Hartleys TNT,TGTP) on both 40 and 80m. It was a blast!. Glad he won. He does an incredible job of digging you out of the noisy mix and holding a QSO. Well deserved win I thought. I would send a call and he was on me like dirt! donVE3LYX

Thanks Mike, CW. We just kept at it till we got a definite one. Same freq same time every night. We are going to try it with the 211 Hartley next. It shouldn't be as hard as it has a lot more suds then the WS 19. We have to wait till tomorrow as it is a CW contest weekend everywhere till midnite. He has a T1154 and we would like to try it too. I have a clone of sorts but it doesn't have CW (yet)

So it was true! Alan Douglas has passed. Alan taken from us way too soon. RIP Alan!
I guess we'll be seeing his collection on eBay ...

73s forever.

Rob aka Vollumscope.

Richard Lloyd Estes, 71 of Medina, OH passed away unexpectedly on Monday,
Nov. 30, 2015 at his home.
He was born Jan. 21, 1944 in Wallins Creek, KY to Cledis and Fredia
(Hensley) Estes. His family moved to the Coshocton area and eventually

settled in Medina County in 1961, where he graduated from Cloverleaf High School. Richard worked as a millwright at Ford Motor Company in Brookpark, retiring in 2006 following 36 years of service.
In the late 60's he was the manager for the Estes Brothers Band. He was a longtime amateur radio operator, receiving his license in 1958. His on air call letters were K8LRY. Richard was also an auctioneer for 23 years, known world -wide for specializing in the sale of vintage radios. He was a car buff, and loved his collection of old cars.
He is survived by his Wife, Kathy to whom he was married to for 38 years,
5 Sons: Cledis (Robin), Herbert, Warren, Michael, and William Estes
6 Grandchildren, Krystin, Rebecca, Bryan, Amber, Justin and Caleb
2 Great Grandchildren
Siblings:
Charlotte (Farley) Wriston Rosemary (Ken) Bishop
Susan Weber Cynthia (Leslie) Brown
Brenda (David) Westover David (Maryann) Estes
John Estes Gary (Ann) Estes
Many nieces, nephews and cousins
He was preceded in death by his parents, son Alex J. II, grandson Matthew Estes, and brothers Jerry, William and Alex Joseph.
Funeral service will be Saturday, Dec. 5, at 11:00 AM at the Parker Funeral Home, 210 Medina St., Lodi (330-948-1122).
Burial will follow at Woodlawn Cemetery in Lodi.
Visitation will be Friday from 6-9 PM at the funeral home.
Online condolences may be shared at www.parkerfuneralhomes.com .

> I was just informed by Harold KB0ROB that 1929 operator Russ Iverson W0CWU passed away yesterday from cancer and pneumonia. Sigh.. Russ was a huge fan of the BK 1929 QSO Party and was always heard on 80m and 40m with his "Big Bertha" MOPA transmitter. He also had a regenerative receiver that he was so proud of. Superb performance. I'm sure most of you worked him in the 29. We'll miss him this weekend! 73, Scott WA9WFA

I remember working Russ on more than one occasion over the years on the BK. He was a good operator. I hope his equipment finds a good home. RIP, Russ.

73,
-Larry/NE1S

14100. FW: ARCI Updates - Sad News and Radio Updates

Yahoo group: antiquewirelessassociation (2010 — 2015)
Date: 2015-12-03 19:20:59 UTC
From: Geoffrey Bourne
Topic: 14100 Message: 14100

Received this in the AM

It is with great sadness that I must announce the passing of Greg Hunolt.

I've come to understand that Greg was doing well yesterday, but suddenly became ill and passed away this afternoon.

Greg's passing is a great loss to WARCI, ARCI and the antique radio community.

Among his accomplishments:
WARCI President 2010 - 2015
WARCI News Editor 2009 - 2015
The Battery Set Compendium (BSC)
WARCI and ARCI Radiofest Auction Coordinator

Anyone that knew Greg knew what a great guy he was: kind, very intelligent, and always willing to lend a hand. He came to an ARCI board meeting in October and was kind enough to take the minutes and compile a summary. He was just discussing the arrangements for the next Radiofest, where he contributed his efforts so generously at our auction. It goes without saying that he'll be sorely missed.
Most importantly, Greg was a great friend to many of us both inside and outside of WARCI. He will be sorely missed.

Please keep Greg's wife Jean Ann in your thoughts and prayers.

Please understand that I have no further information at this time. Once I have details regarding the funeral arrangements, I will pass them along. More information may be available at Sunday's meet.
